FIELD OF THE INVENTION

The present invention is directed to certain novel compounds represented by structural Formula (I)

10

or pharmaceutically acceptable salt forms thereof, wherein R¹, R^{6a}, R^{6b}, R⁷, R⁸, R⁹, X, b, m, and n are described herein. The invention is also concerned with pharmaceutical formulations comprising these novel 15 compounds as active ingredients and the use of the novel compounds and their formulations in the treatment of certain disorders. The compounds of this invention are serotonin agonists and antagonists and are useful in the control or prevention of central nervous system disorders 20 including obesity, anxiety, depression, psychosis, schizophrenia, sleep disorders, sexual disorders, migraine, conditions associated with cephalic pain, social phobias, and gastrointestinal disorders such as dysfunction of the gastrointestinal tract motility.

25

BACKGROUND OF THE INVENTION

There exists a substantial correlation for the relationship between 5-HT₂ receptor modulation and a variety of diseases and therapies. To date, three subtypes 30 of the 5-HT₂ receptor class have been identified, 5-HT_{2A}, 5-HT_{2B}, and 5-HT_{2C}. Prior to the early 1990's the 5-HT_{2C} and 5-HT_{2A} receptors were referred to as 5-HT_{1C} and 5-HT₂, respectively.

The agonism or antagonism of 5-HT2 receptors, either selectively or nonselectively, has been associated with the treatment of various central nervous system (CNS) disorders. Ligands possessing affinity for the 5-HT2

5 receptors have been shown to have numerous physiological and behavioral effects (Trends in Pharmacological Sciences, 11, 181, 1990). In the recent past the contribution of serotonergic activity to the mode of action of antidepressant drugs has been well documented. Compounds
10 that increase the overall basal tone of serotonin in the CNS have been successfully developed as antidepressants. The serotonin selective reuptake inhibitors (SSRI) function by increasing the amount of serotonin present in the nerve synapse. These breakthrough treatments, however, are not
15 without side effects and suffer from delayed onset of action (Leonard, J. Clin. Psychiatry, 54(suppl), 3, 1993). Due to the mechanism of action of the SSRIs, they effect the activity of a number of serotonin receptor subtypes. This non-specific modulation of the serotonin family of
20 receptors most likely plays a significant role in the side effect profile. In addition, these compounds often have a high affinity for a number of the serotonin receptors as well as a multitude of other monoamine neurotransmitters and nuisance receptors. Removing some of the receptor
25 cross reactivity would allow for the examination and possible development of potent therapeutic ligands with an improved side effect profile.

There is ample evidence to support the role of selective 5-HT2 receptor ligands in a number of disease
30 therapies. Modulation of 5-HT2 receptors has been associated with the treatment of schizophrenia and psychoses (Ugedo, L., et.al., Psychopharmacology, 98, 45, 1989). Mood, behavior and hallucinogenesis can be affected by 5-HT2 receptors in the limbic system and cerebral
35 cortex. 5-HT2 receptor modulation in the hypothalamus can influence appetite, thermoregulation, sleep, sexual behavior, motor activity, and neuroendocrine function

(Hartig, P., et.al., Annals New York Academy of Science, 149, 159). There is also evidence indicating that 5-HT2 receptors mediate hypoactivity, effect feeding in rats, and mediate penile erections (Psychopharmacology, 101, 57,

5 1990).

Compounds exhibiting selectivity for the 5-HT2B receptor are useful in treating conditions such as tachygastria, hypermotility associated with irritable bowel disorder, constipation, dyspepsia, and other peripherally mediated conditions.

10 mediated conditions.

5-HT2A antagonists have been shown to be effective in the treatment of schizophrenia, anxiety, depression, and migraines (Koek, W., *Neuroscience and Behavioral reviews*, 16, 95, 1996). Aside from the beneficial antipsychotic effects, classical neuroleptic are frequently responsible for eliciting acute extrapyramidal side effects and neuroendocrine disturbances. These compounds generally possess significant dopamine D2 receptor affinity (as well as other nuisance receptor affinity) which frequently is associated with extra pyramidal symptoms and tardive dyskinesia, thus detracting from their efficacy as front line treatments in schizophrenia and related disorders. Compounds possessing a more favorable selectivity profile would represent a possible improvement for the treatment of

25 CNS disorders

U.S. Patent Numbers 3,914,421; 4,013,652; 4,115,577; 4,183,936; and 4,238,607 disclose pyridopyrrolobenz-heterocycles of formula:

30 where X is O, S, S(=O), or SO₂; n is 0 or 1; R¹ is various carbon substituents, and Z is a monosubstituent of H, methyl, or chloro.

U.S. Patent Number 4,219,550 discloses pyridopyrrolo-benzheterocycles of formula:

where X is O or S; R¹ is C₁₋₄ alkyl or cyclopropyl; R² is H, 5 CH₃, OCH₃, Cl, Br, F, or CF₃; and (A) is -CH₂-, -CH(CH₃)-, or -CH₂CH₂-.

European Patent Application EP 473,550 A1 discloses indolonaphthyridines of formula:

10 wherein X and Y are H or a simple ring, R¹, is H, alkyl, alkylcarbonylalkyl, arylcarbonylalkyl, aralkyl, or a mono or disubstituted carbamoylalkyl; and R³, R⁴, and R⁵ are H, halogen, alkyl, alkoxy, alkylthio or trifluoromethyl.

15 None of the above references suggest or disclose the compounds of the present invention.

There remains a need to discover new compounds useful as serotonin agonists and antagonists which are useful in the control or prevention of central nervous system disorders. As such, the present invention discloses novel 20 compounds which are of low molecular weight, useful as serotonin agonists and antagonists, and provide good in vitro potency.

SUMMARY OF THE INVENTION

25 One object of the present invention is to provide novel compounds which are useful as agonists or antagonists of 5-HT₂ receptors, more specifically 5-HT_{2A} and 5-HT_{2C} receptors, or pharmaceutically acceptable salts or prodrugs thereof.

It is another object of the present invention to provide pharmaceutical compositions comprising a pharmaceutically acceptable carrier and a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt or prodrug form thereof.

It is another object of the present invention to provide a method for treating central nervous system disorders including obesity, anxiety, depression,

10 psychosis, schizophrenia, sleep and sexual disorders, migraine and other conditions associated with cephalic pain, social phobias, and gastrointestinal disorders such as dysfunction of the gastrointestinal tract motility comprising administering to a host in need of such treatment a therapeutically effective amount of at least one of the compounds of the present invention or a pharmaceutically acceptable salt or prodrug form thereof.

15 More specifically, the present invention provides a method for treating obesity, anxiety, depression, or schizophrenia.

20 These and other objects, which will become apparent during the following detailed description, have been achieved by the inventors' discovery that compounds of Formula (I):

(I)

25 or pharmaceutically acceptable salt or prodrug forms thereof, wherein R¹, R^{6a}, R^{6b}, R⁷, R⁸, R⁹, X, b, m, and n are defined below, are effective agonists or antagonists of 5-HT₂ receptors.

R¹¹ is selected from

H, halo, -CF₃, -CN, -NO₂,
C₁₋₄ alkyl, C₂₋₄ alkenyl, C₂₋₄ alkynyl, C₁₋₄ haloalkyl,
10 C₁₋₄ alkoxy, (C₁₋₄ haloalkyl)oxy,
C₃₋₁₀ cycloalkyl substituted with 0-2 R³³,
C₃₋₁₀ carbocyclic residue substituted with 0-3 R³³,
aryl substituted with 0-5 R³³, and
5-6 membered heterocyclic ring system containing 1, 2,
15 or 3 heteroatoms selected from the group
consisting of N, O, and S substituted with 0-3
R³¹;

R¹², at each occurrence, is independently selected from

C₁₋₄ alkyl substituted with 0-1 R^{12a},
C₂₋₄ alkenyl substituted with 0-1 R^{12a},
C₂₋₄ alkynyl substituted with 0-1 R^{12a},
C₃₋₆ cycloalkyl substituted with 0-3 R³³,

5-10 membered heterocyclic ring system containing from
1-4 heteroatoms selected from the group
consisting of N, O, and S substituted with 0-3
R³¹;

30 R^{12a}, at each occurrence, is independently selected from
phenyl substituted with 0-5 R³³;

C₃₋₁₀ carbocyclic residue substituted with 0-3 R³³, and
5-10 membered heterocyclic ring system containing from
35 1-4 heteroatoms selected from the group
consisting of N, O, and S substituted with 0-3
R³¹;

R¹³, at each occurrence, is independently selected from H, C₁₋₄ alkyl, C₂₋₄ alkenyl, and C₂₋₄ alkynyl;

5 alternatively, R¹² and R¹³ join to form a 5- or 6-membered ring optionally substituted with -O- or -N(R¹⁴)-;

10 alternatively, R¹² and R¹³ when attached to N may be combined to form a 9- or 10-membered bicyclic

heterocyclic ring system containing from 1-3 heteroatoms selected from the group consisting of N, O, and S; wherein said bicyclic heterocyclic ring system is selected from indolyl, indolinyl, indazolyl, benzimidazolyl, benzimidazolinyl, benztriazolyl, 15 quinolinyl, tetrahydroquinolinyl, isoquinolinyl, and tetrahydroisoquinolinyl; wherein said bicyclic heterocyclic ring system is substituted with 0-1 R¹⁶;

20 R¹⁴, at each occurrence, is independently selected from H, methyl, ethyl, propyl, and butyl;

25 R¹⁵, at each occurrence, is independently selected from H, methyl, ethyl, propyl, and butyl;

30 R¹⁶, at each occurrence, is independently selected from H, OH, F, Cl, CN, NO₂, methyl, ethyl, methoxy, ethoxy, trifluoromethyl, and trifluoromethoxy;

35 R³¹, at each occurrence, is independently selected from H, OH, halo, CF₃, methyl, ethyl, and propyl;

R³³, at each occurrence, is independently selected from H, OH, halo, CN, NO₂, CF₃, SO₂R⁴⁵, NR⁴⁶R⁴⁷, -C(=O)H, phenyl, C₁₋₆ alkyl, C₂₋₆ alkenyl, C₂₋₆ alkynyl, C₃₋₆ cycloalkyl, C₁₋₄ haloalkyl, C₁₋₄ haloalkyl-oxy-, C₁₋₄ alkyloxy-, C₁₋₄ alkylthio-, C₁₋₄ alkyl-C(=O)-, C₁₋₄ alkyl-C(=O)NH-, C₁₋₄ alkyl-OC(=O)-,

provided that two of R⁷, R⁸, and R⁹, are independently selected from hydrogen, fluoro, chloro, bromo, cyano, methyl, ethyl, propyl, isopropyl, butyl, t-butyl, nitro, 20 trifluoromethyl, methoxy, ethoxy, isopropoxy, and trifluoromethoxy.

25 [8] In an another embodiment, the present invention provides a novel compound of Formula (II):

wherein:

30 b is a single bond, wherein the bridge hydrogens are in a cis or trans position;

R¹ is selected from

hydrogen, methyl, ethyl, n-propyl, n-butyl, s-butyl,
t-butyl, n-pentyl, n-hexyl, 2-propyl, 2-butyl, 2-pentyl,
2-hexyl, 2-methylpropyl, 2-methylbutyl, 2-methylpentyl,
2-ethylbutyl, 3-methylpentyl, 3-methylbutyl,

4-methyl-3-pentenyl, 3,3-dichloro-2-propenyl,
10 trans-3-phenyl-2-propenyl, cyclopropyl, cyclobutyl,
cyclopentyl, cyclohexyl, cyclopropylmethyl,
cyclobutylmethyl, cyclopentylmethyl, cyclohexylmethyl,
-CH=CH₂, -CH₂-CH=CH₂, -CH=CH-CH₃, -C≡CH, -C≡C-CH₃,
and -CH₂-C≡CH;

15 R^{6a} is H;

R^{6b} is H;

20 alternatively, R^{6a} and R^{6b} are taken together to form =O;

R⁷ and R⁹, at each occurrence, are independently selected
from hydrogen, fluoro, methyl, trifluoromethyl, and
methoxy;

25 R⁸ is selected from
hydrogen, fluoro, chloro, bromo, cyano, methyl, ethyl,
propyl, isopropyl, butyl, t-butyl, nitro,
trifluoromethyl, methoxy, ethoxy, isopropoxy,
30 trifluoromethoxy, phenyl;

In a further preferred embodiment the central nervous system disorder comprises obesity.

20 In another further preferred embodiment the central nervous system disorder comprises schizophrenia.

In another further preferred embodiment the central nervous system disorder comprises depression.

In another further preferred embodiment the central nervous system disorder comprises anxiety.

25 In a fourth embodiment the present invention provides novel compounds of Formula (I) or pharmaceutically acceptable salt forms thereof for use in therapy.

In a fifth embodiment the present invention provides the use of novel compounds of Formula (I) or

30 pharmaceutically acceptable salt forms thereof for the manufacture of a medicament for the treatment of central nervous system disorders including obesity, anxiety, depression, psychosis, schizophrenia, sleep disorders, sexual disorders, migraine, conditions associated with

35 cephalic pain, social phobias, and gastrointestinal disorders.

DEFINITIONS

The compounds herein described may have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis from optically active starting materials. Many geometric isomers of olefins, C=N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated.

The numbering of the tetracyclic ring-system present in the compounds of Formula (I), as defined by nomenclature known to one skilled in the art, is shown for two examples in Formula (I'), when k is 1 and n is 1; and in Formula (I''), when k is 1 and n is 2:

The tetracyclic ring-system present in compounds of Formula (I) occur as "cis" or "trans" isomers when the carbon-carbon bond b in Formula (I) is a single bond. As such, the terms "cis" and "trans", in conjunction with the tetracyclic ring structure, refer to the configuration of hydrogen atoms on carbon atoms 8a and 11a in Formula (I') or, for example, on carbon atoms 9a and 12a in Formula (I''), above. When both hydrogens are on the same side of the mean plane determined by the octahydro tetracyclic

moiety then the configuration is designated "cis", if not, the configuration is designated "trans". It is understood that the above example is for demonstrative purposes only and not intended to limit the scope of the tetracyclic

5 ring-system present in compounds of Formula (I). As such, it is understood that one skilled in the art of organic chemistry can apply the above numbering system to other values of m and n in the scope of compounds of Formula (I) to determine the appropriate numbering. Additional Examples 10 of the numbering of the tetracyclic ring-system are further provided below in the synthetic EXAMPLES. Lastly, it is understood that the use of "cis" or "trans" in the identification of the tetracyclic ring-system is not meant to construe the configuration of any other cis or trans 15 geometric isomer in the molecule, for example, cis or trans butene.

The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that 20 the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., $=O$), then 2 hydrogens on the atom are replaced.

When any variable (e.g. R^2 , R^{11} , R^{33} , R^{41} , R^{42} etc.) 25 occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-2 R^2 , then said group may optionally be substituted

30 with up to two R^2 groups and R^2 at each occurrence is selected independently from the definition of R^2 . Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

35 When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is

listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents

5 and/or variables are permissible only if such combinations result in stable compounds.

As used herein, "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of 10 carbon atoms; for example, "C₁-C₆ alkyl" or "C₁₋₆ alkyl" denotes alkyl having 1 to 6 carbon atoms. Examples of alkyl include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, sec-butyl, t-butyl, n-pentyl, n-hexyl, 2-methylbutyl, 2-methylpentyl, 2-ethylbutyl, 3-methylpentyl, and 4-methylpentyl.

"Alkenyl" or "alkenylene" is intended to include hydrocarbon chains of either a straight or branched configuration having the specified number of carbon atoms, for example "C₂₋₆ alkenyl", and one or more unsaturated

20 carbon-carbon bonds which may occur in any stable point along the chain. Examples of alkenyl include, but are not limited to, ethenyl, 1-propenyl, 2-propenyl, 2-butenyl, 3-butenyl, 2-pentenyl, 3, pentenyl, 4-pentenyl, 2-hexenyl, 3-hexenyl, 4-hexenyl, 5-hexenyl, 2-methyl-2-propenyl, 4-methyl-3-pentenyl, and the like.

"Alkynyl" or "alkynylene" is intended to include hydrocarbon chains of either a straight or branched configuration, having the specified number of carbon atoms, for example "C₂₋₆ alkynyl", and one or more carbon-carbon

30 triple bonds which may occur in any stable point along the chain, such as ethynyl, propynyl, butynyl, pentynyl, hexynyl and the like.

"Cycloalkyl" is intended to include saturated ring groups, having the specified number of carbon atoms. For example, "C₃-C₆ cycloalkyl" denotes such as cyclopropyl, cyclobutyl, cyclopentyl, or cyclohexyl.

"Alkoxy" or "alkyloxy" represents an alkyl group as defined above with the indicated number of carbon atoms attached through an oxygen bridge. Examples of alkoxy include, but are not limited to, methoxy, ethoxy,

5 n-propoxy, i-propoxy, n-butoxy, s-butoxy, t-butoxy, n-pent oxy, and s-pent oxy. Similarly, "alkylthio" is represents an alkyl group as defined above with the indicated number of carbon atoms attached through a sulphur bridge.

10 "Halo" or "halogen" as used herein refers to fluoro, chloro, bromo, and iodo; and "counterion" is used to represent a small, negatively charged species such as chloride, bromide, hydroxide, acetate, sulfate, and the like.

15 "Haloalkyl" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms, substituted with 1 or more halogen (for example $-C_vF_w$ where $v = 1$ to 3 and $w = 1$ to $(2v+1)$). Examples of haloalkyl include, but 20 are not limited to, trifluoromethyl, trichloromethyl, pentafluoroethyl, pentachloroethyl, 2,2,2-trifluoroethyl, heptafluoropropyl, and heptachloropropyl.

As used herein, "carbocycle" is intended to mean any stable 3- to 7-membered monocyclic or bicyclic or 7- to 25 13-membered bicyclic or tricyclic, any of which may be saturated, partially unsaturated, or aromatic. Examples of such carbocycles include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantlyl, cyclooctyl, [3.3.0]bicyclooctane, 30 [4.3.0]bicyclononane, [4.4.0]bicyclodecane (decalin), [2.2.2]bicyclooctane, fluorenyl, phenyl, naphthyl, indanyl, adamantlyl, or tetrahydronaphthyl (tetralin).

As used herein, the term "heterocycle" or "heterocyclic ring" or "heterocyclic ring system" is 35 intended to mean a stable 5- to 7- membered monocyclic or bicyclic or 7- to 14-membered bicyclic heterocyclic ring which is saturated partially unsaturated or unsaturated

(aromatic), and which consists of carbon atoms and 1, 2, 3 or 4 heteroatoms independently selected from the group consisting of N, O and S and including any bicyclic group in which any of the above-defined heterocyclic rings is

5 fused to a benzene ring. The nitrogen and sulfur heteroatoms may optionally be oxidized. The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The heterocyclic rings described herein may be substituted on
10 carbon or on a nitrogen atom if the resulting compound is stable. If specifically noted, a nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not
15 adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1.

Examples of heterocycles include, but are not limited to, 1H-indazole, 2-pyrrolidonyl, 2H,6H-1,5,2-dithiazinyl, 20 2H-pyrrolyl, 3H-indolyl, 4-piperidonyl, 4aH-carbazole, 4H-quinolizinyl, 6H-1,2,5-thiadiazinyl, acridinyl, azocinyl, benzimidazolyl, benzofuranyl, benzothiofuranyl, benzothiophenyl, benzoxazolyl, benzoxazolinyl, benzthiazolyl, benztriazolyl, benztetrazolyl,
25 benzisoxazolyl, benzisothiazolyl, benzimidazolonyl, carbazolyl, 4aH-carbazolyl, b-carbolinyl, chromanyl, chromenyl, cinnolinyl, decahydroquinolinyl, 2H,6H-1,5,2-dithiazinyl, dihydrofuro[2,3-*b*]tetrahydrofuran, furanyl, furazanyl, imidazolidinyl, imidazolinyl, imidazolyl, imidazolopyridinyl, 1H-indazolyl, indolanyl, indolinyl, indolizinyl, indolyl, isatinoyl, isobenzofuranyl, isochromanyl, isoindazolyl, isoindolinyl, isoindolyl, isoquinolinyl, isothiazolyl, isothiazolopyridinyl, isoxazolyl, isoxazolopyridinyl,
30 morpholinyl, naphthyridinyl, octahydroisoquinolinyl, oxadiazolyl, 1,2,3-oxadiazolyl, 1,2,4-oxadiazolyl, 1,2,5-oxadiazolyl, 1,3,4-oxadiazolyl, oxazolidinyl,

oxazolyl, oxazolopyridinyl, oxazolidinylperimidinyl,
oxindolyl, phenanthridinyl, phenanthrolinyl, phenarsazinyl,
phenazinyl, phenothiazinyl, phenoxathiinyl, phenoxazinyl,
phthalazinyl, piperazinyl, piperidinyl, pteridinyl,
5 piperidonyl, 4-piperidonyl, pteridinyl, purinyl, pyranyl,
pyrazinyl, pyrazolidinyl, pyrazolinyl, pyrazolopyridinyl,
pyrazolyl, pyridazinyl, pyridooxazole, pyridoimidazole,
pyridothiazole, pyridinyl, pyridyl, pyrimidinyl,
pyrrolidinyl, pyrrolinyl, pyrrolyl, quinazolinyl,
10 quinolinyl, 4H-quinolizinyl, quinoxalinyl, quinuclidinyl,
carbolinyl, tetrahydrofuranyl, tetrahydroisoquinolinyl,
tetrahydroquinolinyl, 6H-1,2,5-thiadiazinyl,
1,2,3-thiadiazolyl, 1,2,4-thiadiazolyl, 1,2,5-thiadiazolyl,
15 1,3,4-thiadiazolyl, thianthrenyl, thiazolyl,
thiazolopyridinyl, thienyl, thienothiazolyl,
thienooxazolyl, thienoimidazolyl, thiophenyl, triazinyl,
1,2,3-triazolyl, 1,2,4-triazolyl, 1,2,5-triazolyl,
20 1,3,4-triazolyl, and xanthenyl. Preferred heterocycles
include, but are not limited to, pyridinyl, furanyl,
thienyl, pyrrolyl, pyrazolyl, pyrazinyl, piperazinyl,
imidazolyl, indolyl, benzimidazolyl, 1H-indazolyl,
oxazolidinyl, benzotriazolyl, benzisoxazolyl, benzoxazolyl,
oxindolyl, benzoxazolinyl, benzthiazolyl, benzothiazolyl,
isatinoyl, isoxazolopyridinyl, isothiazolopyridinyl,
25 thiazolopyridinyl, oxazolopyridinyl, imidazolopyridinyl,
and pyrazolopyridinyl. Preferred 5 to 6 membered
heterocycles include, but are not limited to, pyridinyl,
furanyl, thienyl, pyrrolyl, pyrazolyl, pyrazinyl,
piperazinyl, imidazolyl, and oxazolidinyl. Also included
30 are fused ring and spiro compounds containing, for example,
the above heterocycles.

As used herein, the term "bicyclic heterocyclic ring system" is intended to mean a stable 9- to 10-membered bicyclic heterocyclic ring formed from the substituent
35 NR¹²R¹³, which is partially unsaturated or unsaturated (aromatic), and which consists of carbon atoms, a nitrogen atom, and 1 or 2 additional heteroatoms independently

selected from the group consisting of N, O and S. The additional nitrogen or sulfur heteroatoms may optionally be oxidized. The heterocyclic ring is attached to its pendant group by the nitrogen atom of the group NR¹²R¹³ and for

5 which results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. If specifically noted, a nitrogen in the heterocycle may 10 optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. The term "bicyclic 15 heterocyclic ring system" is intended to be a subset of the term "heterocyclic ring system". Preferred examples of a 9- to 10- membered bicyclic heterocyclic ring system are benzimidazolyl, benzimidazoliny, benzoxazoliny, dihydrobenzthiazolyl, dihydrodioxobenzthiazolyl, benzisoxazoliny, 1H-indazolyl, indolyl, indolinyl, 20 isoindoliny, tetrahydro-isoquinolinyl, tetrahydro-quinolinyl, and benzotriazolyl.

Additionally, a subclass of preferred heterocycles are heterocycles which function as an isostere of a cyclic but non-heterocyclic substituent such as -CH₂-C(=O)-phenyl.

25 Preferred examples of such heterocycles include, but are not limited to, benzimidazolyl, benzofuranyl, benzothiophenyl, benzoxazolyl, benzthiazolyl, benzisoxazolyl, furanyl, imidazoliny, 1H-indazolyl, indoliny, isoindoliny, isoquinolinyl, oxazolyl, 30 piperidiny, pyrazinyl, pyridinyl, pyrimidiny, quinolinyl, thiazolyl, thiophenyl, and 1,2,3-triazolyl.

As used herein, the term "aryl", or aromatic residue, is intended to mean an aromatic moiety containing six to ten carbon atoms, such as phenyl, pyridinyl and naphthyl.

35 The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the

scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts 10 include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium 15 salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and 20 the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, 25 methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical 30 methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, 35 ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, PA,

1985, p. 1418, the disclosure of which is hereby incorporated by reference.

"Prodrugs" are intended to include any covalently bonded carriers which release the active parent drug

5 according to formula (I) *in vivo* when such prodrug is administered to a mammalian subject. Prodrugs of a compound of formula (I) are prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine
10 manipulation or *in vivo*, to the parent compound. Prodrugs include compounds of formula (I) wherein a hydroxy, amino, or sulfhydryl group is bonded to any group that, when the prodrug or compound of formula (I) is administered to a mammalian subject, cleaves to form a free hydroxyl, free
15 amino, or free sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of Formula (I), and the like.
20 "Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The compounds of the present invention can be prepared in a number of ways well known to one skilled in the art of organic synthesis. The compounds of the present invention

5 can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below.

10 All references cited herein are hereby incorporated in their entirety herein by reference.

The novel compounds of this invention may be prepared using the reactions and techniques described in this section. The reactions are performed in solvents

15 appropriate to the reagents and materials employed and are suitable for the transformations being effected. Also, in the description of the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction 20 atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. It is understood by one skilled in the art of organic synthesis 25 that the functionality present on various portions of the molecule must be compatible with the reagents and reactions proposed. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternate methods 30 must then be used.

The preparation of compounds of Formula (I) of the present invention may be carried out in a convergent or sequential synthetic manner. Detailed synthetic preparations of the compounds of Formula (I) are shown in 35 the following reaction schemes. The skills required in preparation and purification of the compounds of Formula (I) and the intermediates leading to these compounds are

known to those in the art. Purification procedures include, but are not limited to, normal or reverse phase chromatography, crystallization, and distillation.

Several methods for the preparation of the compounds 5 of the present invention are illustrated in the schemes and examples shown below. The substitutions are as described and defined above.

The compounds of Formula (I) where $n = 1$ and $m = 1$ can be prepared as described in Scheme 1. Protection of the 10 anilines (II) with BOC_2O and a base such as triethylamine affords a carbamate intermediate which serves to direct subsequent deprotonation with *sec*-BuLi (TMEDA, -78 °C, ether) to occur at the adjacent aryl-H bond (see Beak, P., et. al., *Tetrahedron Lett.* 1989, 30, 1197; and Iwao, M., et. al., *Heterocycles*, 1992, 34, 1031). Quenching with an appropriate electrophile, such as N,N-dimethylformamide, affords the aldehydes (III). Horner-Emmons reaction of aldehydes (III) with an appropriate phosphonate (IV) in the presence of a base affords the α,β -unsaturated esters (V), where the olefin geometry can be controlled by the nature 20 of the phosphonate (IV) and the conditions of the reaction. For example, under standard conditions, using a phosphonate (IV) where R' is Me or Et and using sodium hydride as a base leads to (V) with the E-olefin geometry as the nearly 25 exclusive product. Alternatively, using a phosphonate (IV) where R' is 2,2,2-trifluoroethyl or Ar, generating its potassium enolate with potassium hexamethyldisilazide or potassium carbonate and 18-crown-6, and allowing it to react with aldehyde (III) leads to (V) with Z-olefin 30 geometry as the nearly exclusive product (see Still, W. C., et. al., *Tetrahedron Lett.* 1983, 24, 4405; for a review of Z-selective Horner-Emmons reactions, see Jiro, M. *Trends Org. Chem.* 1998, 7, 63). Olefins (V) can serve as dipolarophiles in 1,3-dipolar cycloadditions with 35 appropriate azomethine ylides to afford the pyrrolidines (VII) (for reviews of 1,3-dipolar cycloaddition chemistry of azomethine ylides, see *1,3-Dipolar Cycloaddition*

Chemistry, A. Padwa, Ed., Wiley-Interscience, New York, 1984). The required azomethine ylide can be generated in several ways, two preferred methods of which are described.

The commercially available tertiary amine (VI) can be

5 treated with 5-25 mol% TFA in methylene chloride to generate the required azomethine ylide and 1,3-dipolar cycloaddition then occurs at room temperature or reflux temperature to afford (VII). Alternatively, N-benzylglycine can be refluxed with paraformaldehyde in a 10 suitable solvent such as toluene or benzene to generate the azomethine ylide. These methods produce (VII) where the pyrrolidine nitrogen is protected with a benzyl group. The 1,3-dipolar cycloaddition is stereospecific in that the stereochemistry of the olefin is retained and translated 15 into the relative stereochemistry of the pyrrolidine products. Thus, E-olefins undergo cyclization to produce pyrrolidines (VII) with a trans configuration of the 3,4-substituents on the pyrrolidine ring and Z-olefins undergo cyclization to produce pyrrolidines (VII) with a cis 20 configuration of the 3,4-substituents on the pyrrolidine ring. Removal of the BOC group under acidic conditions, for example with TFA, affords an aniline which can undergo ring-closing condensation on the ester group, either with heating or with heating in the presence of an acid such as 25 p-toluenesulfonic acid, to afford the tetracyclic compounds (VIII).

Compounds of Formula (I) where $n = 1$ and $m = 1$, and where R^{6a} and R^{6b} taken together are carbonyl, i.e. compounds (IX), are prepared by removal of the N-benzyl 30 group of (VIII) either by catalytic hydrogenation over Pd/C or $Pd(OH)_2/C$ catalyst, or by reaction with α -chloroethyl chloroformate (ACE-Cl) and subsequent refluxing in methanol, followed by N-alkylation of the secondary amine with an appropriate R^1I and an appropriate base, such as 35 potassium carbonate. Compounds of Formula (I) where $n = 1$ and $m = 1$, and where R^{6a} and R^{6b} are hydrogen, i.e. compounds (XI), can also be prepared from (VIII). Removal

of the N-benzyl group as just described can be followed by protecting the secondary amine as a BOC carbamate by reaction with BOC₂O to afford (X). Alternatively, (X) can be prepared directly from (VIII) by performing the

5 catalytic hydrogenation using Pd(OH)₂/C catalyst in the presence of BOC₂O. Reduction of the lactam carbonyl with a reducing agent such as borane-tetrahydrofuran complex or DIBAL, followed by acidic BOC deprotection and subsequent N-alkylation as described above affords tetracyclic
10 compounds (XI).

Alternatively, the compounds of Formula (I) where n = 1 and m = 1 and where the ring fusion is cis can be prepared as described in Scheme 2. The aldehydes (III),

15 prepared as described in Scheme 1, can be condensed with dimethyl or diethyl malonate in the presence of catalytic piperidine or piperidine benzoate with removal of water to afford an α,β -unsaturated diester. Removal of the BOC group under acidic conditions and subsequent ring-closing condensation, which occurs spontaneously or with heating,
20 affords the tricyclic compounds (XII). The 1,3-dipolar cycloaddition of this substrate with an appropriately generated azomethine ylide as described in Scheme 1 then affords the tetracyclic compounds (XIII) with a cis ring fusion. Decarboxylation can be accomplished by basic
25 hydrolysis followed by heating the resulting acid, such as by refluxing in dioxane, or by heating the ester (XIII) under acidic conditions, to afford (XIV) which has retained the cis ring fusion. Tetracyclic compounds (XIV) can be converted to the compounds of Formula (I) where n = 1 and m
30 = 1, where the ring fusion is cis, and where R⁶ and R^{6a} taken together are carbonyl, i.e. compounds (XV), by the procedures described in Scheme 1. Likewise, compounds (XIV) can be converted to the compounds of Formula (I) where n = 1 and m = 1, where the ring fusion is cis, and
35 where R^{6a} and R^{6b} are hydrogen, i.e. compounds (XVII), by the procedures described in Scheme 1.

Scheme 1.

An alternative synthesis of the tricyclic esters (XII) is described in Scheme 3. Condensation of the anilines (II) with trimethyl or triethyl methanetricarboxylate at elevated temperature affords the tricyclic esters (XVIII). Conversion of the hydroxy group to chloro can be accomplished with phosphorous oxychloride and triethylamine at elevated temperature. The chloro can be reduced to

afford compounds (XII) for example by treating with tributyltin hydride (see Neumann, W. P., *Synthesis*, 1987, 665). Compounds (XII) can then be carried on to the compounds of Formula (I) as described in Scheme 2.

5

Scheme 2.

Scheme 3.

Compounds (XII) can be used as an alternative way to 5 prepare compounds of Formula (I) where n = 1 and m = 1 as described in Scheme 4. Michael addition of nucleophiles such as cyanide ion or nitromethane anion to (XII) affords 10 compounds (XIX). Reduction to a primary amine by catalytic hydrogenation, or, in the case of the nitromethane adduct, reducing agents such as tin (II) chloride, can be followed by ring-closing condensation under thermal conditions with or without acid catalysis to afford the tetracyclic bis-lactams (XX). Selective reduction of the less hindered 15 secondary lactam can be accomplished with borane under controlled conditions, or by derivatization of the secondary lactam with phosphorous oxychloride or triethyloxonium tetrafluoroborate followed by reduction with sodium borohydride. N-alkylation of the resulting secondary amine as described in Scheme 1 affords compounds 20 (IX). Alternately, (XX) can be exhaustively reduced using borane or LAH and subsequently N-alkylated as described to afford compounds (XI).

Scheme 4.

Compounds (XII) can also be used as an alternative way to prepare compounds of Formula (I) where $n = 1$ and $m = 1$

5 and the ring fusion is *cis*, as described in Scheme 5. Chlorination of (XVIII) with phosphorous oxychloride provides a chloro analog which can be displaced by appropriate nucleophiles such as cyanide ion and nitromethane anion to afford (XXI). Catalytic 10 hydrogenation and subsequent ring-closing condensation affords the *cis*-fused tetracyclic bis-lactam (XXII), the relative stereochemistry being set by the addition of hydrogen across the double bond. Following the procedures described in Scheme 4, bis-lactams (XXII) can be converted 15 to *cis*-fused tetracyclic compounds (XV) and (XVII).

Scheme 5.

The compounds of Formula (I) where $n = 1$ and $m = 2$ or where $n = 2$ and $m = 1$, and where the ring fusion is *cis* can be prepared as described in the following Schemes. As

5 described in Scheme 6, (XIII) can undergo [3+2] cycloaddition with 2-[(trimethylsilyl)methyl]-2-propen-1-yl acetate (XXIII) in the presence various palladium catalysts, such as $(\text{Ph}_3\text{P})_4\text{Pd}$, $(\text{Ph}_3\text{P})_4\text{Pd/dppc}$, $\text{Pd}(\text{OAc})_2$ and PPh_3 , or $\text{Pd}(\text{OAc})_2$ and $\text{P}(\text{OR})_3$, to afford a cyclopentane-fused compound containing an *exo*-methylene group (see

10 Trost, B. M., et. al., *J. Am. Chem. Soc.* 1983, 105, 2315). Oxidative cleavage of the *exo*-methylene residue, such as with ozone or osmium tetroxide and sodium periodate, affords the tetracyclic cyclopentanones (XXIV) with a *cis* 15 ring fusion. Decarboxylation can be accomplished as described previously by basic hydrolysis followed by heating, such as in refluxing dioxane, to afford (XXV).

Ring expansion with incorporation of the nitrogen functionality can be accomplished in several ways. For example, Schmidt rearrangement (as described by Smith, P.A.S., *J. Am. Chem. Soc.*, 1948, 320) is effected by

5 treatment of the carbonyl derivative (XXV) with NaN_3 and methanesulfonic acid to afford a mixture of the bicyclic lactams (XXVI) and (XXVII). Alternatively, this transformation may be carried out under Hoffmann rearrangement protocol (see, for example, Dike, S.Y., et. al., *Bioorg. Med. Chem. Lett.*, 1991, 383), by initial formation of the oxime derivative of (XXV) by treatment with hydroxylamine hydrochloride. Subsequent rearrangement to the lactam is efficiently accomplished by heating in 10 polyphosphoric acid to afford a mixture of the lactams (XXVI) and (XXVII).

15

Scheme 6.

The conversion of lactams (XXVI) and (XXVII) to compounds of Formula (I) can be accomplished as described in Scheme 7. As described in Scheme 4, selective reduction 5 of the secondary lactam of (XXVI) or (XXVII) followed by N-alkylation leads to tetracyclic compounds (XXVIII) or (XXX), respectively. Also as described in Scheme 4, exhaustive reduction of (XXVI) or (XXVII) and subsequent N-alkylation affords compounds (XXIX) or (XXXI), 10 respectively.

Alternately, the compounds of Formula (I) where $n = 1$ and $m = 2$ or where $n = 2$ and $m = 1$, and where the ring fusion is trans can be prepared as described in Scheme 8.

The E-olefin (XXXII), prepared as described in Scheme 1,

15 can be subjected to the palladium catalyzed [3+2] cycloaddition with 2-[(trimethylsilyl)methyl]-2-propen-1-yl acetate (XXIII) as described in Scheme 6 and subsequently oxidatively cleaved to the ketone (XXXIII), where the E-olefin geometry is conserved in the product to give the

20 trans cyclopentanone stereochemistry. Deprotection of the BOC carbamate under acidic conditions followed by ring-closing condensation under thermal conditions with or without acid catalysis affords the tetracyclic compounds (XXXIV). Ring expansion with incorporation of the nitrogen

25 functionality can be accomplished in several ways as described in Scheme 6. For example, Schmidt rearrangement is effected by treatment of the carbonyl derivative (XXXIV) with NaN_3 and methanesulfonic acid to afford a mixture of the bicyclic lactams (XXXV) and (XXXVI). Alternatively,

30 this transformation may be carried out under Hoffmann rearrangement protocol by initial formation of the oxime derivative of (XXXIV) by treatment with hydroxylamine hydrochloride. Subsequent rearrangement to the lactam is efficiently accomplished by heating in polyphosphoric acid 35 to afford a mixture of the lactams (XXXV) and (XXXVI).

Following procedures described in previous schemes, (XXXV) and (XXXVI) can be converted to final compounds (XXXVII)

and (XXXVIII), respectively, where depending on the lactam reduction conditions, R^{6a} and R^{6b} can be hydrogen or taken together to be a carbonyl residue.

Scheme 7.

Scheme 8.

The anilines (II) which are used as starting materials for the compounds of Formula (I) are readily available by 5 many methods known to those skilled in the art of organic synthesis. Also, many of the starting anilines (II) are commercially available, especially where R⁷, R⁸ and R⁹ are H, such as 1,2,3,4-tetrahydroquinoline (X = CH₂). Some methods which can be used to prepare anilines (II) are 10 described in the following Schemes. In Scheme 9 are shown

methods to prepare anilines (II) where X is O or S. The readily available *ortho*-amino phenols or thiophenols (XXXIX) can be O- or S-alkylated with a bromoacetate in the presence of a base such as sodium hydride or potassium

5 carbonate. Subsequent heating affords the lactams (XL). Lactams (XL) can also be prepared by a similar sequence starting with the analogous *ortho*-nitro phenols or thiophenols and adding an additional nitro group reduction step after the O- or S-alkylation step. The lactams (XL) 10 can be readily reduced by a variety of reducing agents, such as borane, LAH, DIBAL, etc., to afford the anilines (II) where X is O or S. Alternately, treatment of α -halonitrobenzenes (XLII) in the presence of a suitable base 15 such as triethylamine or potassium carbonate affords nitro esters (XLIII). Nitro group reduction by a variety of procedures, for example catalytic hydrogenation over palladium catalyst or treatment with tin (II) chloride, affords the aniline, which either spontaneously or upon 20 heating provides the lactams (XL). Lactam reduction as described then affords the anilines (II) where X is O or S.

Scheme 9.

Scheme 10.

To prepare anilines (II) where X is OCH_2 or SCH_2 very

5 similar chemistry can be used as described in Scheme 10. The *ortho*-amino phenols or thiophenols (XXXIX) can be O- or S-alkylated with a bromopropionate (XLIV) in the presence of a base such as sodium hydride or potassium carbonate. Subsequent heating affords the seven-membered lactams

10 (XLV). The lactams (XLV) can be readily reduced by a variety of reducing agents, such as borane, LAH, DIBAL, etc., to afford the anilines (II) where X is OCH_2 or SCH_2 . Alternately, treatment of α -halonitrobenzenes (XLII) with 3-hydroxy or 3-mercaptopropionates (XLVI) in the presence of

15 a suitable base such as triethylamine or potassium carbonate affords nitro esters (XLVII). Nitro group reduction by a variety of procedures, for example catalytic

hydrogenation over palladium catalyst or treatment with tin (II) chloride, affords the aniline, which either spontaneously or upon heating provides the lactams (XLV).

Lactam reduction as described then affords the anilines

5 (II) where X is OCH_2 or SCH_2 . Alternatively, (XLI) can be displaced with alcohol or thiol (XLVIII) to afford (XLIX). Reduction of the nitro group followed by intramolecular N-alkylation, under the influence of basic and/or thermal conditions would afford anilines (II) where X is OCH_2 or

10 SCH_2 .

The anilines (II) where X is CH_2O or CH_2S can be prepared as described in Scheme 11. The ortho-amino benzyl alcohols and benzylthiols (L) are available by procedures known to those skilled in the art, for example, the benzyl

15 alcohols are readily derived from reduction of appropriate anthranilic acid derivatives. O- or S-alkylation with bromoacetates in the presence of a base such as sodium hydride or potassium tert-butoxide affords an intermediate which when heated can undergo ring-closing condensation to

20 afford the seven-membered lactams (LI). Reduction of the lactam as described previously affords anilines (II) where X is CH_2O or CH_2S . Alternatively, radical bromination of ortho-nitrotoluenes (LII) followed by displacement with a hydroxy- or mercaptoacetate (XLII) under basic conditions

25 affords nitroesters (LIII). Nitro group reduction, ring-closing condensation and lactam reduction can be accomplished as described in previous Schemes to afford the anilines (II) where X is CH_2O or CH_2S .

Scheme 11.

An alternative to the procedures described in Schemes 9-11 is described in Scheme 12. Esters (LIV) can be

5 prepared by procedures known to those skilled in the art, including some of the procedures described in Schemes 9-11. Hydrolysis of the ester forms an acid which, when treated under Friedel-Crafts acylation conditions (see Ed. G.A. Olah, "Friedel-Crafts and Related Reactions", J. Wiley and Sons, New York, 1964, Vol 3, Pts 1 and 2 or Chem. Rev., 1955, 229, or Olah, G.A., "Friedel-Crafts Chemistry", Wiley Interscience, New York, 1973, for varying conditions and protocols), i.e. strong Lewis acids (AlCl_3 , FeCl_3 , etc.), affords the cyclic ketones (LV). Incorporation of the

10 15 nitrogen functionality can be accomplished in several ways. For example, Schmidt rearrangement (as described by Smith, P.A.S., *J. Am. Chem. Soc.*, 1948, 320) is effected by treatment of the carbonyl derivative (LV) with NaN_3 and methanesulfonic acid to afford the bicyclic lactam (LVI).

20 Alternatively, this transformation may be carried out under Hoffmann rearrangement protocol (see, for example, Dike, S.Y., et. al., *Bioorg. Med. Chem. Lett.*, 1991, 383), by initial formation of the oxime derivative of (LV) by

treatment with hydroxylamine hydrochloride. Subsequent rearrangement to the lactam is efficiently accomplished by heating in polyphosphoric acid to afford the lactam (LVI). Reduction of the lactam (LVI) can be accomplished with a variety of reducing agents, for example, borane-THF complex, LAH and the like to afford the aniline intermediates (II).

Scheme 12.

10

The preparation of anilines (II) where X is NR¹⁰, CH₂NR¹⁰, NR¹⁰CH₂, CONH or NHCO is shown in Scheme 13. N-Acylation of readily available ortho-nitroanilines (LVII) with chloroacetyl chloride (LVIII) in the presence of a suitable base, such as triethylamine, affords an amide. Nitro group reduction and ring closure under basic or thermal conditions affords the aniline (II) where X is NHCO. The ortho-nitroanilines (LIX), which can be derived from N-alkylation of (LVII) or by displacement of an ortho-fluoro- or ortho-chloro-nitrobenzene with R¹⁰NH₂, can be N-acylated with (LX) where n" is 1 or 2. Nitro group reduction and ring closure affords the amides (LXI). Reduction of the amide using borane or LAH then affords the

anilines (II) where X is $NR^{10}CH_2$ or NR^{10} . N-Alkylation of amino ester (LXIII) with a benzyl bromide (LXII) affords a benzylamine intermediate. Alternatively, this benzylamine can also be derived from reductive amination of an

5 appropriate ortho-nitrobenzaldehyde with (LXIII) in the presence of acetic acid and a hydride source such as sodium cyanoborohydride or sodium triacetoxyborohydride. N-Alkylation with $R^{10}I$ and base or by a reductive amination procedure affords (LXIV). Nitro group reduction and ring closure affords an amide, which can be reduced with borane or LAH to give aniline (II) where X is CH_2NR^{10} . N-Acylation of amine (LXVI) with an acid chloride (LXV) in the presence of a base such as triethylamine affords amide (LXVII). Nitro group reduction and ring closure gives aniline (II) where X is CONH.

The preparation of compounds of Formula (I) with additional diversity of functionalization of the aromatic A ring of the tetracycle is shown in the following Schemes. As shown in Scheme 14, bromination of the compounds

20 (LXVIII, $R^8 = H$) (where R^{6a} and R^{6b} of Formula (I) are H) when the amine is protected, for example, with the Boc or CBZ protecting groups, with, for example, NBS in DMF affords the R^8 brominated derivatives (LXIX). These activated aryl derivatives (LXIX) act as excellent 25 counterparts for a number of important synthetic transformations.

Scheme 13.

For example, biaryl coupling is accomplished under Suzuki coupling protocol. For a review and leading

5 references of palladium catalyzed cross coupling reactions, see Miyaura, N., Suzuki, A., *Chem. Rev.*, 1995, 2457. One such procedure entails treatment of the aryl bromide (LXIX) with a functionalized aryl boronic acid (LXX) in the presence of a catalytic Pd(0) species, such as Pd(PPh₃)₄,

10 Pd(PPh₃)₂Cl₂, Pd(OAc)₂, Pd₂(dba)₃ and a suitable ligand

such as PPh_3 , AsPh_3 , etc., or other such Pd(0) catalyst, and a base such as Na_2CO_3 , Ba(OH)_2 or Et_3N in a suitable solvent such as DMF, toluene, THF, DME or the like, to afford the biaryl derivatives (LXXI).

5

Scheme 14.

Alternatively formation of the boronic ester (i.e. (LXVIII, $\text{R}^8 = \text{B}(\text{OR})_2$) from the bromine derivative (LXIX)

10 would allow for greater diversity in the subsequent coupling of this boronic acid with commercially available haloaromatic derivatives in a similar Suzuki coupling strategy as described above to afford compounds (LXXI). One such procedure is shown in Scheme 15. Treatment of

15 bromides (LXIX) with a palladium catalyst such as $\text{Pd}(\text{PPh}_3)_4$ or $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ and a suitable base, a preferred one being potassium acetate, in the presence of diboron pinacol ester (LXXII) affords the aryl boronic ester (LXXIII). This boronic ester can undergo Suzuki coupling directly with a

20 wide variety of commercially available aryl bromides (LXXIV) under typical Suzuki conditions as described in Scheme 13 to afford the biaryl compounds (LXXI).

Scheme 15.

Similarly, biaryl coupling of the derivatives (LXXV)

5 is shown in Scheme 16. Protection of the amine
functionality must be carried out if R¹ = H (see Greene
et.al for protections of amines). This is readily
accomplished, for example, by treatment of the derivatives
(LXXV) with (BOC)₂O in aqueous sodium hydroxide and
10 dioxane. Subsequent Suzuki coupling with a variety of aryl
boronic acids is carried out as described above in Scheme
14, to afford the biaryl adducts (LXXVI). This protocol is
amenable to R⁷, R⁸, and R⁹ bromide, iodide, triflates,
and/or diazo derivatives (see Miyaura, N., Suzuki, A.,
15 *Chem. Rev.*, 1995, 2457, for a review of aryl couplings).

Scheme 16.

R⁷, R⁸ or R⁹ = Br, I, OTf, N₂⁺
 R¹ = H

also for R⁷, R⁸
 R¹ = BOC

In addition, there exists a wide range of procedures and protocols for functionalizing haloaromatics,

5 aryldiazonium and aryltriflate compounds. These procedures are well known by those in the art and described, for example, by Stanforth, S.P., *Tetrahedron*, 1998, 263; Buchwald, S.L., et. al., *J. Am. Chem. Soc.*, 1998, 9722; Stille, J.K., et. al., *J. Am. Chem. Soc.*, 1984, 7500.

10 Among these procedures are biaryl couplings, alkylations, acylations, aminations, and amidations. The power of palladium catalyzed functionalization of aromatic cores has been explored in depth in the last decade. An excellent review of this field can be found in J. Tsuji, "Palladium Reagents and Catalysts, Innovations in Organic Synthesis", J. Wiley and Sons, New York, 1995.

One such example is described in Scheme 17, where the aromatic A ring of Formula (I) is substituted with an arylamino group. Treatment of bromide (LXIX) with

20 benzophenone imine in the presence of a palladium (0) catalyst, such as Pd₂(dba)₃, Pd(PPh₃)₄ or Pd(PPh₃)₂Cl₂, and a suitable ligand such as BINAP or PPh₃, and a base such as NaOtBu in a suitable solvent such as DMF, toluene, THF, DME or the like, affords an imine in which nitrogen is attached to the aromatic ring. Hydrolysis of this imine, for example with hydroxylamine and sodium acetate in methanol, affords the aniline (LXXVII). This aniline (LXXVII) can be treated with a wide variety of commercially available aryl

bromides (LXXIV) in the presence of a palladium (0) catalyst, such as $\text{Pd}_2(\text{dba})_3$, $\text{Pd}(\text{PPh}_3)_4$ or $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$, and a suitable ligand such as BINAP or PPh_3 , and a base such as NaOtBu in a suitable solvent such as DMF, toluene, THF, DME or the like, to afford the biaryl anilines (LXXVIII). In analogy with Scheme 16, the chemistry described in Scheme 17 can also be applied to analogs of (LXIX) where the R^7 or R^9 groups are Br , I , OTf , etc., to afford analogs of (LXXVIII) where the arylamino group is on the R^7 or R^9 position.

Scheme 17.

Another Example is shown in Scheme 18. Treatment of the anilines (LXXVII) with an appropriate benzaldehyde (LXXIX) in the presence of a suitable reducing agent such as sodium triacetoxyborohydride or sodium cyanoborohydride and generally under mildly acidic conditions, such as in the presence of acetic acid, in a suitable solvent such as 1,2-dichloroethane, THF, methanol or acetonitrile, affords the benzylamine analogs (LXXX). An alternate method for preparing benzylamines (LXXX) or α -substituted benzylamines (LXXXII) proceeds from bromides (LXIX). Treatment of bromide (LXIX) with benzylamines (L), which can be chiral if R^{10} is an appropriate group, such as alkyl, in the presence of a palladium (0) catalyst, such as $Pd_2(dba)_3$, $Pd(PPh_3)_4$ or $Pd(PPh_3)_2Cl_2$, and a suitable ligand such as 15 BINAP or PPh_3 , and a base such as $NaOtBu$ or Na_2CO_3 in a suitable solvent such as DMF, toluene, THF, DME or the like, affords the benzylamines (LXXXII). In analogy with previous schemes, the chemistry described in Scheme 18 can also be applied to analogs of (LXXVII) or (LXIX) where the 20 R^7 or R^9 groups are NH_2 , Br, I, OTf, etc., to afford analogs of (LXXX) or (LXXXII) where the benzylamino group is on the R^7 or R^9 position.

Scheme 18.

Another example is shown in Scheme 19. Treating

5 bromides (**LXIX**) with an appropriate benzylic zinc reagent
(LXXXIII), which can be generated from the corresponding
benzyl halide, in the presence of a palladium (0) catalyst
such as $\text{Pd}(\text{PPh}_3)_4$, $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$, or $\text{Pd}_2(\text{dba})_3$, and with or
without a copper (I) salt, affords the derivatives (**LXXXIV**)
10 where R^8 is a benzyl group (see Knochel, P., et. al. *Chem.*
Rev. 1993, 93, 2117; and Weichert, A., et. al. *Syn. Lett.*
1996, 473). This chemistry can also be extended to
include a variety of alkylzinc and cycloalkylzinc reagents,
which are available from the corresponding alkyl halides
15 and cycloalkyl halides. In analogy with previous schemes
the chemistry described in Scheme 19 can also be applied to
analogs of (**LXIX**) where the R^7 or R^9 groups are Br , I , OTf ,
etc., to afford analogs of (**LXXXIV**) where the benzyl or
alkyl or cycloalkyl group is on the R^7 or R^9 position.

Scheme 19.

Another example is shown in Scheme 20. Compounds 5 (LXIX), where X is bromo or preferably iodo, can be treated with various phenols (LXXXV) in the presence of a base such as Cs_2CO_3 and a copper catalyst such as $\text{CuPF}_6(\text{CH}_3\text{CN})_4$ at elevated temperature to afford biaryl ethers (LXXXVI) (see Sawyer, J. S. *Tetrahedron* 2000, 56, 5045). In analogy 10 with previous schemes the chemistry described in Scheme 20 can also be applied to analogs of (LXIX) where the R^7 or R^9 groups are Br, I, OTf, etc., to afford analogs of (LXXXVI) where the aryloxy group is on the R^7 or R^9 position.

Scheme 20.

15

The compounds of Formula (I) with substituted R^1 sidechains can be prepared as described in Scheme 21. Alkylation of the derivatives (I, $\text{R}^1 = \text{H}$) with a haloalkyl 20 ester, such as $\text{ClCH}_2(\text{CH}_2)_p\text{CO}_2\text{Me}$, in the presence of NaI or

KI and a base such as K_2CO_3 , Na_2CO_3 or the like, in dioxane or THF or other such solvent while heating (see Glennon, R.A., et. al., *Med. Chem. Res.*, 1996, 197) affords the R^1 alkylated esters. Subsequent formation of the activated 5 amides (LXXXVII) is accomplished by treatment of the ester with N,O -dimethylhydroxylamine hydrochloride and a Lewis acid such as trimethylaluminum or triethylaluminum in toluene (see, for example, Golec, J.M.C., et. al., *Tetrahedron*, 1994, 809) at $0^\circ C$. Treatment of the amide 10 (LXXXVII) with a variety of organometallic agents, such as Grignard reagents $R^{1a}MgBr$, alkyl and aryl lithium reagents etc. (see Sibi, M.P., et. al., *Tetrahedron Lett.*, 1992, 1941; and more generally House, H.O., *Modern Synthetic Reactions*, W.A. Benjamin, Inc., Menlo Park, CA., 1972), in 15 a suitable solvent such as THF, ether, etc. at low temperatures affords the substituted ketones (LXXXVIII).

Scheme 21.

20

Compounds of Formula (I) where R^{6a} and R^{6a} taken together are S can be prepared as described in Scheme 22.

Compounds of Formula (I) where R^{6a} and R^{6b} taken together are O are treated with Lawesson's reagent or P_2S_5 to afford the thiolactams (I), where R^{6a} and R^{6b} taken together are S.

Scheme 22.

5

(I) ($R^{6a}, R^{6b} = O$)

(I) ($R^{6a}, R^{6b} = S$)

Compounds of Formula (I) where X is $S(O)_n$, $S(O)_nCH_2$ and $CH_2S(O)_n$ are prepared as shown in Scheme 23. Compounds of Formula (I) where $X = S$, SCH_2 and CH_2S can be readily 10 oxidized by a variety of oxidizing agents, such as MCPBA, oxone or sodium periodate. Also, depending on the number of equivalents of oxidizing agent used, the reaction can be varied to provide compounds (I) where X is $S(O)_n$, $S(O)_nCH_2$ and $CH_2S(O)_n$, where $n = 1$ (sulfoxide) or $n = 2$ (sulfone). 15

Scheme 23.

(I) ($X = S, SCH_2, CH_2S$)

(I) ($X = S(O)_n, S(O)_nCH_2,$
 $CH_2S(O)_n$)

The compounds of Formula (I) where R^{6a} is C1-4 alkyl and R^{6b} is H can be prepared as shown in Scheme 24.

20 Treatment of (I), where R^{6a} and R^{6b} taken together are carbonyl, with an appropriate alkylcerium reagent, which is prepared in situ from the corresponding alkylolithium reagent, or an appropriate alkyl Grignard reagent, followed

by reduction of the intermediate under acidic conditions with a borohydride reagent, such as sodium borohydride, affords the compounds (I), where R^{6a} is C1-4 alkyl and R^{6b} is H (see Nukui, S., et. al. *J. Org. Chem.* 1995, 60, 398).

5 and Aube, J., et. al. *Heterocycles* 1993, 35, 1141).
 Alternatively, treatment of (I), where R^{6a} and R^{6b} taken
 together are carbonyl, with an appropriate dialkyl
 titanocene (see Petasis, N. A., et. al. *Tetrahedron Lett.*
 1995, 36, 2393 and references cited therein) affords an
 10 amino olefin which can be reduced with sodium borohydride
 under acidic conditions to afford compounds (I), where R^{6a}
 is Cl-4 alkyl and R^{6b} is H.

Scheme 24.

EXAMPLES

The detailed processes for preparing the compounds of Formula (I) are illustrated by the following EXAMPLES. It is, however, understood that this invention is not limited to the specific details of these EXAMPLES. The EXAMPLES as set forth below are intended to demonstrate the scope of the invention but are not intended to limit the scope of the invention.

EXAMPLE 1

(\pm)-trans-10-benzyl-5,6,9,10,11,11a-hexahydro-4H-pyrido[3,2,1-ij]pyrrolo[3,4-c]quinolin-8(8aH)-one, hydrochloride salt.

Part A. *tert*-butyl 3,4-dihydro-1(2*H*)-quinolinecarboxylate.

5 To a solution of 1,2,3,4-tetrahydroquinoline (20.0 g, 0.15 mol) in 300 mL of methylene chloride at ambient temperature was added di-*tert*-butyl dicarbonate (36.0 g, 0.165 mol) and triethylamine (23.0 mL, 0.165 mol). The resulting mixture was allowed to stir at 40 °C for 24 h. The reaction was 10 allowed to cool to ambient temperature and the methylene chloride was removed under reduced pressure. The residue was dissolved in ethyl acetate, washed with 10% aqueous HCl, saturated aqueous sodium bicarbonate and brine, dried (MgSO₄) and concentrated in vacuo. The residue was 15 purified by flash chromatography (elution with 8:1 hexane/ethyl acetate) to afford 25.4 g (72%) of the title compound as an oil. ¹H NMR (CDCl₃): δ 7.66 (d, 1H, J=8.4 Hz), 7.15 (t, 1H, J=8.5 Hz), 7.09 (d, 1H, J=7.0 Hz), 7.00 (t, 1H, J=7.3 Hz), 3.75-3.71 (m, 2H), 2.78 (app t, 2H, J=6.6 Hz), 1.94 (app quintet, 2H, J=6.0 Hz), 1.54 (s, 9H).

20

Part B. *tert*-butyl 8-formyl-3,4-dihydro-1(2*H*)-quinolinecarboxylate.

To a solution of *tert*-butyl 3,4-dihydro-1(2*H*)-25 quinolinecarboxylate (10.3 g, 44.1 mmol) in 200 mL of diethyl ether at -78 °C was added *N,N,N',N'*-tetramethylethylenediamine (7.98 mL, 52.9 mmol) and then *sec*-butyllithium (40.7 mL of a 1.3 M solution in cyclohexane, 52.9 mmol) was added dropwise via addition 30 funnel. The mixture was stirred at -78 °C for 1 h, at which time a precipitate had formed. *N,N*-dimethylformamide (5.1 mL, 66.1 mmol) was added dropwise in 10 mL of diethyl ether and the resulting mixture was stirred at -78 °C for 1 h, at which time the precipitate had largely disappeared.

The reaction was quenched by the addition of 25 mL of saturated aqueous ammonium chloride and then was diluted with water and ethyl acetate. The organics were washed with 10% aqueous HCl, saturated aqueous sodium bicarbonate and brine, dried (MgSO_4) and concentrated in vacuo.

5 The residue was purified by flash chromatography (elution with 5:1 hexane/ethyl acetate) to afford 5.7 g (50%) of the title compound a pale yellow solid. ^1H NMR (CDCl_3): δ 9.98 (broad s, 1H), 7.72 (d, 1H, $J=7.7$ Hz), 7.34 (d, 1H, $J=6.9$ Hz), 7.21 (t, 1H, $J=7.5$ Hz), 4.50-4.30 (very broad m, 1H), 3.30-3.10 (very broad m, 1H), 2.86 (app t, 2H, $J=6.7$ Hz), 2.06-1.95 (broad m, 2H), 1.44 (broad s, 9H).

10 **Part C. *tert*-butyl 8-[(1E)-3-ethoxy-3-oxo-1-propenyl]-3,4-dihydro-1(2H)-quinolinecarboxylate.**

15 Sodium hydride (0.50 g of 60% dispersion in mineral oil, 12.6 mmol) was washed with 10 mL of hexane and suspended in 30 mL of tetrahydrofuran. To this suspension was added triethyl phosphonoacetate (2.52 mL, 12.6 mmol) and the

20 resulting mixture was stirred at ambient temperature for 30 min, at which time the solution was homogeneous. To this solution was added *tert*-butyl 8-formyl-3,4-dihydro-1(2H)-quinolinecarboxylate (3.0 g, 11.5 mmol) in 10 mL of tetrahydrofuran and the resulting solution was stirred at

25 ambient temperature for 1h. The reaction was diluted with water and extracted with ethyl acetate. The organics were washed with brine, dried (MgSO_4), filtered through a pad of silica gel and concentrated in vacuo to afford 3.7 g (97%) of the title compound which was used without purification.

30 ^1H NMR (CDCl_3): δ 7.74 (d, 1H, $J=16.1$ Hz), 7.51-7.48 (m, 1H), 7.21-7.11 (m, 2H), 6.42 (d, 1H, $J=16.1$ Hz), 4.50-4.35 (broad m, 1H), 4.27 (dq, 2H, $J=7.2$, 2.4 Hz), 3.15-3.00 (broad s, 1H), 2.79-2.74 (m, 2H), 2.22-2.10 (broad m, 1H), 1.89-1.78 (broad s, 1H), 1.39 (broad s, 9H), 1.33 (t, 3H).

Part D. *(+)-trans-tert-butyl 8-[1-benzyl-4-(ethoxycarbonyl)-3-pyrrolidinyl]-3,4-dihydro-1(2H)-quinolinecarboxylate.*

(+)-*cis*-5,6,9,10,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinolin-8 (8a*H*)-one, hydrochloride salt.

To a solution of (+)-*cis*-10-benzyl-5,6,9,10,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinolin-8(*8aH*)-one from EXAMPLE 8, Part C (170 mg, 0.53 mmol) in 20 5 mL

5 of toluene was added 1-chloroethyl chloroformate (0.12 mL, 1.07 mmol) and the resulting solution was stirred at 110 °C for 3 h. The reaction mixture was cooled and the toluene was removed under reduced pressure. The residue was taken up in 20 mL of methanol and was stirred at 65 °C for 1 h.

10 The reaction was cooled and the methanol was removed under reduced pressure. The residue was purified by preparative HPLC (C18 reverse phase column, elution with a H₂O/CH₃CN gradient with 0.5% TFA). Product-containing fractions were combined, concentrated and partitioned between chloroform

15 and saturated aqueous sodium carbonate. The organics were washed with brine, dried (K₂CO₃) and concentrated in vacuo to afford 40 mg (32%) of the free base. The residue (40 mg, 0.17 mmol) was dissolved in ether and there was added 2M HCl in ether (0.085 mL, 0.17 mmol). The solvent was

20 decanted and the remaining solid was triturated twice with ether and was dried in vacuo to afford 40 mg (86%) of the title compound of EXAMPLE 10 as an off white powder. ¹H NMR (d₆-dmso): δ 7.16-7.10 (m, 2H), 6.97 (t, 1H, J=7.5 Hz), 4.10-4.00 (m, 2H), 3.85 (dd, 1H, J=11.5, 1.3 Hz),

 Pd_2Dba_3 (0.015 g, 0.017 mmol) in 20 ml of degassed toluene
 was heated for 3 hrs at 90 °C. The solution was cooled and
 20 filtered through a pad of silica gel and eluted with EtOAc.
 The volatiles were removed under reduced pressure. The
 residue was taken up in 50 mL of methanol and then there
 was added NaOAc (0.28 g, 3.36 mmol) and hydroxylamine
 hydrochloride (0.35 g, 5.04 mmol) and the mixture was
 25 stirred at ambient temperature for 30 min. The volatiles
 were removed under reduced pressure and the residue
 purified by column chromatography (eluting with a gradient
 of 100% diethyl ether to 100% EtOAc) to afford the title
 compound. LRMS (ES)⁺: 330.4 (M+H)⁺.

Part B. (+)-*cis*-tert-butyl 2-anilino-5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate.

A solution of (*±*)-*cis*-tert-butyl 2-amino-5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate (0.08 g, 0.25 mmol), bromobenzene (0.04 g, 0.27 mmol), BINAP (0.001 g, 0.0015 mmol), sodium-t-

5 butoxide, (0.06 g, 0.65 mmol) and Pd₂DBA₃ (0.0005 g, 0.0005 mmol) in 10 ml of degassed toluene was heated for 16 h at 90 °C. The solution was cooled and filtered through a pad of silica gel and eluted with EtOAc. The volatiles were removed under reduced pressure to afford the title compound

10 which was used without purification. LRMS (ES)⁺: 406.4 (M+H)⁺.

Part C. (*±*)-*cis*-*N*-phenyl-5,6,8,8a,9,10,11,11a-octahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinolin-2-amine.

(8a*R*,11a*R*)-5,6,8,8a,9,10,11,11a-octahydro-4*H*-pyrido[3,2,1-
15 *ij*]pyrrolo[3,4-*c*]quinoline, bis-hydrochloride salt.

15 **Part A. Ethyl 5-oxo-2,3-dihydro-1*H*,5*H*-pyrido[3,2,1-*ij*]quinoline-6-carboxylate.**
To a solution of *tert*-butyl 8-formyl-3,4-dihydro-1(2*H*)-
20 quinolinecarboxylate from EXAMPLE 1, Part B (17.0 g, 65.0
mmol) in 300 mL of benzene in a flask fitted with a Dean-
Stark trap and a condenser was added diethyl malonate (10.4
g, 65 mmol), piperidine (0.61 g, 7.14 mmol) and benzoic
acid (0.79 g, 6.5 mmol). The resulting solution was
stirred at 80 °C for 24 h with collection of water in the
25 Dean-Stark trap. The reaction mixture was then cooled,
washed with 1N HCl, sat'd aq NaHCO₃ and brine, dried
(MgSO₄), filtered through a pad of silica gel and
concentrated to afford 25.1 g of a diester intermediate.
This material was dissolved in 160 mL of methylene chloride
30 and then there was added 40 mL of trifluoroacetic acid.
This mixture was allowed to stir at ambient temperature for
24 h. The volatiles were then removed in vacuo and the
residue was dissolved in ethyl acetate, washed with water,
sat'd aq NaHCO₃ and brine, dried (MgSO₄), filtered through

a pad of silica gel and concentrated to a solid. This material was triturated with hexane, filtered and dried to afford 14.4 g (86%) of the title compound of Part A as a pale yellow solid. ¹H NMR (CDCl₃) δ : 8.35 (s, 1H), 7.46

5 (d, 1H, J = 7.7 Hz), 7.36 (dd, 1H, J = 7.4, 1.1 Hz), 7.13 (t, 1H, J = 7.5 Hz), 4.40 (q, 2H, J = 7.2 Hz), 4.19 (app t, 2H, J = 5.9 Hz), 2.95 (t, 2H, J = 6.2 Hz), 2.14-2.05 (m, 2H), 1.40 (t, 3H, J = 7.2 Hz).

10 Part B. (+)-*cis* ethyl 10-benzyl-8-oxo-5,6,9,10,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-8a(8*H*)-carboxylate.

To a solution of ethyl 5-oxo-2,3-dihydro-1*H*,5*H*-pyrido[3,2,1-*ij*]quinoline-6-carboxylate (25.0 g, 97 mmol)

15 in 400 mL of methylene chloride was added *N*-(methoxymethyl)-*N*-(trimethylsilylmethyl)benzylamine (46.1 g, 194 mmol) and trifluoroacetic acid (2.22 g, 19 mmol). The reaction mixture was stirred at 40 °C for 24 h. The reaction mixture was allowed to cool and was washed with

20 sat'd aq. NaHCO₃ and brine, dried (K₂CO₃) and concentrated in vacuo. The residue was purified by recrystallization from 4:1 hexane/ethyl acetate to afford 36.6 g (96%) of the title compound of Part B as an off white solid. ¹H NMR (CDCl₃) δ :

25 7.37-7.20 (m, 5H), 7.05-7.00 (m, 1H), 6.97-6.88 (m, 2H), 4.28-4.19 (m, 1H), 4.12-4.01 (m, 2H), 3.80-3.68 (m, 4H), 3.57 (ABq, 2H, J_{AB} = 10.2 Hz), 3.17 (app t, 1H, J = 8.8 Hz), 2.85-2.77 (m, 2H), 2.49 (app t, 1H, J = 9.5 Hz), 2.05-1.95 (m, 2H), 1.09 (t, 3H, J = 7.0 Hz).

30 Part C. (+)-*cis* 10-benzyl-5,6,9,10,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinolin-8(8*aH*)-one.

To a solution of (+)-*cis* ethyl 10-benzyl-8-oxo-5,6,9,10,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-8a(8*H*)-carboxylate (36.6 g, 93.7 mmol) in 400

35 mL of 1,4-dioxane was added 400 mL of 3M HCl and the resulting mixture was stirred at 100 °C for 24 h. The dioxane and most of the water was removed in vacuo, and the

residue was basified with 1N NaOH and extracted with ethyl acetate. The layers were separated and the organics were washed with brine, dried (MgSO_4) and concentrated to afford 28.0 g (94%) of the title compound of Part C, which was

5 sufficiently pure to be used without purification. ^1H NMR (CDCl_3) δ : 7.25-7.15 (m, 5H), 6.93-6.78 (m, 3H), 4.02-3.93 (m, 1H), 3.78-3.66 (m, 1H), 3.63 (s, 2H), 3.55-3.45 (m, 1H), 3.35 (dd, 1H, J = 9.7, 8.3 Hz), 3.20-3.07 (m, 2H), 2.96 (dd, 1H, J = 9.5, 5.1 Hz), 2.75-2.68 (m, 2H), 2.32 (app t, 1H, J = 9.4 Hz), 1.92-1.82 (m, 2H).

10 **Part D. (\pm)-*cis* tert-butyl 8-oxo-5,6,8a,9,11,11a-hexahydro-4H-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate.**

15 To a Parr shaker bottle which had been purged with nitrogen was added 20% palladium hydroxide on carbon catalyst (9.0 g), 250 mL of absolute ethanol, (\pm)-*cis* 10-benzyl-5,6,9,10,11,11a-hexahydro-4H-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinolin-8(8a*H*)-one (28.0 g, 88.0 mmol) and di-tert-butyl dicarbonate (21.1 g, 96.8 mmol). This mixture was shaken on a Parr apparatus under 60 psi of hydrogen for 24 h. The reaction was filtered through Celite and was concentrated in vacuo to afford 28.8 g (99%) of the title compound of Part D, which was sufficiently pure to be used without 20 purification. ^1H NMR (CDCl_3) δ : 7.07-7.00 (m, 2H), 6.93 (t, 1H), 4.23-4.10 (m, 2H), 3.80-3.57 (m, 3H), 3.51-3.41 (m, 1H), 3.10-3.00 (m, 2H), 2.82-2.75 (m, 2H), 1.97-1.88 (m, 2H), 1.44 and 1.41 (two s, 9H).

30 **Part E. (\pm)-*cis* tert-butyl 5,6,8a,9,11,11a-hexahydro-4H-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate.** To a solution of (\pm)-*cis* tert-butyl 8-oxo-5,6,8a,9,11,11a-hexahydro-4H-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate (28.8 g, 87.7 mmol) in 400 mL of tetrahydrofuran at 0 °C was added borane-THF complex (438 mL of a 1M solution in THF, 438 mmol) via an addition 35

funnel. After the addition was complete the reaction mixture was allowed to warm to ambient temperature and was stirred for 24 h. The reaction was quenched by dropwise addition of methanol (100 mL) and then the volatiles were removed in vacuo. The residue was dissolved in ethyl acetate, washed with sat'd aq. NaHCO₃ and brine, dried (MgSO₄) filtered through a pad of silica gel and concentrated. The solid residue was triturated with hexane, filtered and dried to afford 23.5 g (85%) of the title compound of Part E as a pale yellow solid. ¹H NMR (CDCl₃) δ: 6.86-6.80 (m, 2H), 6.57 (t, 1H), 3.96-3.82 (m, 1H), 3.65-3.58 (m, 2H), 3.38-3.30 (m, 1H), 3.25-2.75 (overlapping m, 7H), 2.65-2.57 (m, 1H), 2.04-1.95 (m, 2H), 1.44 (s, 9H).

15 **Part F. *tert*-butyl (8a*S*,11a*R*)-5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate and *tert*-butyl (8a*R*,11a*S*)-5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate.**

20 The racemic mixture (+)-*cis* *tert*-butyl 5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate (23.5 g) from Part E was separated on a chiralcel OD HPLC column (5% acetonitrile/5% isopropanol/90% supercritical CO₂, ambient temperature,

25 flow rate = 2.0 mL/min, detection 250 nM) to afford 10.0 g of *tert*-butyl (8a*S*,11a*R*)-5,6,8a,9,11,11a-hexahydro-4*H*-pyrido[3,2,1-*ij*]pyrrolo[3,4-*c*]quinoline-10(8*H*)-carboxylate (>99% ee) as the first eluting peak (retention time 11.8 min) and 9.5 g of *tert*-butyl (8a*R*,11a*S*)-5,6,8a,9,11,11a-

5 10(*8H*)-carboxylate from EXAMPLE 7, Part A (55 mg, 0.139 mmol), Ba(OH)₂·8 H₂O (70 mg, 0.222 mmol), and 2,4-dichlorophenyl boronic acid (35 mg, 0.181 mmol) in DME (3 mL) and water (2 mL) were degassed with argon at near reflux temperature. The solution was cooled to rt, and a mixture of solid PPh₃ (5.5 mg, 20.9 μmol) and Pd(PPh₃)₂Cl₂ (5 mg, 6.95 μmol) was added in a single portion. The solution was stirred at reflux under a positive pressure of argon for 4 h. After the starting bromide was consumed, the DME was removed under reduced pressure. The residue was 10 diluted with EtOAc and washed with water followed by brine. The organic layer was dried over Na₂SO₄, and evaporated under reduced pressure to a golden oil (80 mg crude weight). The crude product was purified on a Redipak (5 g) silica column using a gradient elution of 5%-33% EtOAc in 15 hexanes. Evaporation of the fractions containing product 20 as identified by TLC gave *N*-Boc protected biaryl intermediate as a white foam (44 mg, 69%). The *N*-Boc protected indoline (44 mg, 95.8 μmol) was dissolved into CH₂Cl₂ (9.0 mL) and cooled to 0 °C under N₂. Neat 25 trifluoroacetic acid (TFA) was added via syringe in a single portion to the stirred, cooled solution. The reaction was stirred at 0 °C for 2 h and followed by TLC analysis. When all of the *N*-Boc protected material had 30 been consumed, the solution was basified to pH >10 with 3 N NaOH. The product was extracted into CH₂Cl₂, washed with brine, and dried over Na₂SO₄. The solvent was evaporated under reduced pressure to give crude free-base. The crude free-base was purified by semi-preparative HPLC (Dynamax 60 Å, C-18) using an isocratic mobile phase of 50:50:0.05

v/v/v water:acetonitrile:TFA. The title compound of EXAMPLE 34 was obtained as a yellow semi-solid (26 mg, 76%). ^1H NMR (500 MHz, CDCl_3) δ 0.88 (m, 1H), 1.26 (broad s, 2H), 1.91-1.94 (m, 1H), 2.00-2.06 (m, 1H), 2.28 (m, 1H), 2.72 (broad s, 1H), 2.95 (m, 1H), 3.0-3.5 (m, 4H), 3.59 (m, 2H), 3.83 (broad s, 1H), 6.68 (s, 1H), 6.91 (s, 1H), 7.21 (m, 2H), 7.42 (s, 1H). 5,6,8,8a,9,10,11,11a-octahydro-4H-pyrido[3,2,1-
i]pyrrolo[3,4-c]quinolin-2-amine

A solution of (+)-trans tert-butyl 2-amino-5,6,8a,9,11,11a-hexahydro-4H-pyrido[3,2,1-ij]pyrrolo[3,4-c]quinoline-10(8H)-carboxylate (100 mg, 0.304 mmol), sodium tert-butoxide (58 mg, 0.608 mmol), and 3-bromo-4-chlorobenzotrifluoride (95 mg, 0.365 mmol) in anhydrous toluene (6 mL) were degassed with argon at 85 °C for 15

min. The solution was cooled slightly, and a mixture of solid $\text{Pd}_2(\text{dba})_3$ (5.6 mg, 6.1 μmol) and solid BINAP (11 mg, μmol) were added to the solution. The flask was capped under a positive pressure of Ar and heating was continued

5 at 85 °C overnight. After the reaction was complete as evidenced by the lack of starting aniline by TLC analysis, the solution was cooled and diluted with ether. The red slurry was filtered through Celite 521® and concentrated under reduced pressure to give crude *N*-Boc protected
10 biarylamine as a red oil (101 mg). The crude product was purified by silica gel chromatography on the Isco Combi-flash unit using a 10-g RediSep cartridge and a gradient elution of ethyl acetate in hexanes from 5% to 75%. A CH_2Cl_2 (4 mL) solution of the *N*-Boc protected product was
15 cooled to 0 °C and treated with trifluoroacetic acid (TFA) (250 μL). The disappearance of *N*-Boc protected material was followed by TLC analysis (1:1 hexanes:EtoAc) over 8 h. The TFA solution was then basified with 3 N NaOH to pH >12 and extracted with CH_2Cl_2 . Evaporations of the extracts
20 gave 21 mg of the title compound of EXAMPLE 72 as an off-white powder. ^1H NMR (500 MHz, CDCl_3) δ 1.26 (br s, 1H), 1.95 (m, 1H), 2.0 (m, 1H), 2.15 (m, 1H), 2.74 (m, 4H), 2.90 (t, 1H, J = 1.9 Hz), 3.29 (m, 1H), 3.33 (m, 4H), 3.51 (t, 1H, J = 1.9 Hz), 5.96 (s, 1H), 6.52 (s, 1H), 6.69 (s, 1H),

 25 benzaldehyde (28 mg, 0.26 mmol), crushed 4A molecular sieves and three drops of glacial acetic acid. The reaction was stirred at ambient temperature for 1 h and then there was added sodium triacetoxyborohydride (76 mg, 0.36 mmol). The reaction was stirred at ambient temperature for 3 h and then was quenched by the addition of aq ammonium hydroxide. The mixture was extracted with

methylene chloride, washed with brine, dried (K_2CO_3) and concentrated. The residue was taken up in 10 mL of methylene chloride and then there was added 5 mL of trifluoroacetic acid. The reaction was allowed to stir at ambient temperature for 3 h and then was concentrated in vacuo. The residue was purified by preparative HPLC (C18 reverse phase column, elution with a H_2O/CH_3CN gradient with 0.5% TFA) to afford the title compound of EXAMPLE 76 as a powder. (+)-cis-9-benzyl-4,5,8,9,10,10a-hexahydrodipyrrolo[3,4-c:3',2',1'-ij]quinolin-7(7aH)-one, hydrochloride salt.

Part A. *tert*-butyl 1-indolinecarboxylate.

5 To a solution of di-*tert*-butyl dicarbonate (47.2 g, 21.6 mmol) in 150 mL of tetrahydrofuran at ambient temperature was added indoline (24.5 g, 20.6 mmol) dropwise via an addition funnel at a rate to maintain a steady gas evolution. The addition was complete in about 45 min and then the reaction was allowed to stir an additional 3 h. The mixture was filtered through a pad of silica gel and concentrated in vacuo. Any excess di-*tert*-butyl dicarbonate was removed by heating at 70 °C under high vacuum. There was obtained 44 g (97%) of the title compound of Part A which was used without purification. ¹H NMR (CDCl₃) δ: 7.85 and 7.50 (very broad singlets, 1H), 7.20-7.13 (m, 2H), 6.94 (t, 1H), 3.99 (t, 2H, J = 8.6 Hz), 3.11 (t, 2H, J = 8.6 Hz), 1.59 (s, 9H).

20 **Part B. *tert*-butyl 7-formyl-1-indolinecarboxylate.**

To a solution of *tert*-butyl 1-indolinecarboxylate (10.0 g, 45.6 mmol) in 200 mL of diethyl ether at -78 °C was added *N,N,N',N'*-tetramethylethylenediamine (8.3 mL, 54.7 mmol) and then *sec*-butyllithium (42.0 mL of a 1.3 M solution in cyclohexane, 54.7 mmol) was added dropwise via addition funnel. The mixture was stirred at -78 °C for 1 h and then *N,N*-dimethylformamide (5.3 mL, 68.4 mmol) was added dropwise in 10 mL of diethyl ether and the resulting mixture was stirred at -78 °C for 1 h. The reaction was quenched by the addition of 25 mL of saturated aqueous ammonium chloride and then was diluted with water and ethyl acetate. The organics were washed with 10% aqueous HCl, sat'd aq. sodium bicarbonate and brine, dried (MgSO₄) and concentrated in vacuo. The residue was purified by flash

chromatography (elution with 6:1 hexane/ethyl acetate) to afford 6.0 g (53%) of the title compound as an oil which solidified on standing. ^1H NMR (CDCl_3) δ : 10.12 (d, 1H, J = 0.7 Hz), 7.65 (d, 1H), 7.37 (dd, 1H), 7.13 (t, 1H), 4.19 (t, 2H, J = 8.0 Hz), 3.09 (t, 2H, J = 8.2 Hz), 1.53 (s, 9H).

5 **Part C. ethyl 4-oxo-1,2-dihydro-4H-pyrrolo[3,2,1-*ij*]quinoline-5-carboxylate.**

10 To a solution of tert-butyl 7-formyl-1-indolinecarboxylate (6.0 g, 24.3 mmol) in 150 mL of benzene in a flask fitted with a Dean-Stark trap and a condenser was added diethyl malonate (3.89 g, 24.3 mmol), piperidine (0.27 mL, 2.67 mmol) and benzoic acid (0.30 g, 2.43 mmol). The resulting
15 solution was stirred at 80 °C for 24 h with collection of water in the Dean-Stark trap. The reaction mixture was then cooled, washed with 1N HCl, sat'd aq NaHCO_3 and brine, dried (MgSO_4), filtered through a pad of silica gel and concentrated to afford 9.4 g of a diester intermediate.
20 This material was dissolved in 40 mL of methylene chloride and then there was added 10 mL of trifluoroacetic acid. This mixture was allowed to stir at ambient temperature for 4 h. The volatiles were then removed in vacuo and the residue was dissolved in ethyl acetate, washed with water, 25 sat'd aq NaHCO_3 and brine, dried (MgSO_4), filtered through a pad of silica gel and concentrated to a solid. This material was triturated with hot hexane, filtered and dried to afford 2.8 g (47%) of the title compound of Part C as a tan powder. ^1H NMR (CDCl_3) δ : 8.47 (s, 1H), 7.48 (dd, 1H, J = 8.0, 0.8 Hz), 7.43 (dd, 1H, J = 7.1, 0.9 Hz), 7.19 (t, 1H, J = 7.5 Hz), 4.53-4.38 (m, 4H), 3.45 (t, 2H, J = 8.0 Hz), 1.43 (t, 3H, J = 7.1 Hz).

To a solution of ethyl 4-oxo-1,2-dihydro-4*H*-pyrrolo[3,2,1-*ij*]quinoline-5-carboxylate (2.53 g, 10.4 mmol) in 30 mL of 5 methylene chloride was added *N*-(methoxymethyl)-*N*- (trimethylsilylmethyl)benzylamine (4.9 g, 20.8 mmol) and trifluoroacetic acid (0.16 mL, 2.1 mmol). The reaction mixture was stirred at 40 °C for 4 h. The reaction mixture was allowed to cool and was concentrated. The residue was dissolved in ethyl acetate and was washed with sat'd aq. 10 NaHCO₃ and brine, dried (MgSO₄), filtered through a pad of silica gel and concentrated in vacuo to afford the title compound of Part D, which was used without purification.

Part A. *tert*-butyl 3,4-dihydro-1,5-benzoxazepine-5(2*H*)-carboxylate.

A solution of 2,3,4,5-tetrahydro-1,5-benzoxazepine (2.6 g, 17.4 mmol) in 20 mL of methylene chloride and 20 mL of 1N NaOH was degassed with a stream of argon and then there was added di-tert-butyl dicarbonate (4.2 g, 19.2 mmol). The resulting two-phase mixture was stirred at 40 °C for 24 h with vigorous stirring. The reaction mixture was cooled, diluted with ethyl acetate, washed with H₂O and brine, dried (MgSO₄) and concentrated. The residue was purified by flash chromatography (elution with 8:1 hexane/ethyl acetate) to afford 2.3 g (53%) of the title compound of Part A. ¹H NMR (CDCl₃) δ: 7.21 (broad s, 1H), 7.10 (dd, 1H, J = 8.1, 1.5 Hz), 7.00 (app d, 2H, J = 7.4 Hz), 4.20-4.07 (broad m, 2H), 3.77-3.65 (broad m, 2H), 2.12-2.02 (m, 2H), 1.42 (broad s, 9H).

Part B. *tert*-butyl 6-formyl-3,4-dihydro-1,5-benzoxazepine-5(2H)-carboxylate.

To a solution of *tert*-butyl 3,4-dihydro-1,5-benzoxazepine-5(2H)-carboxylate (2.15 g, 8.62 mmol) in 50 mL of diethyl ether at -78 °C was added *N,N,N',N'*-tetramethylethylenediamine (1.6 mL, 10.35 mmol) and then *sec*-butyllithium (8.0 mL of a 1.3 M solution in cyclohexane, 10.35 mmol) was added dropwise via addition funnel. The mixture was stirred at -78 °C for 1 h and then *N,N*-dimethylformamide (1.0 mL, 12.93 mmol) was added dropwise in 10 mL of diethyl ether and the resulting mixture was stirred at -78 °C for 1 h. The reaction was quenched by the addition of 10 mL of saturated aqueous ammonium chloride and then was diluted with water and ethyl acetate. The organics were washed with 10% aqueous HCl, sat'd aq. sodium bicarbonate and brine, dried (MgSO₄) and concentrated in vacuo. The residue was purified by flash chromatography (elution with 5:1 hexane/ethyl acetate) to afford 2.0 g (84%) of the title compound as an oil which was determined to be a mixture of the title compound and the 9-formyl regioisomer. The mixture of products was carried forward.

Part C. ethyl 6-oxo-3,4-dihydro-2*H*,6*H*-[1,4]oxazepino[2,3,4-*ij*]quinoline-7-carboxylate.

To a solution of *tert*-butyl 6-formyl-3,4-dihydro-1,5-

5 benzoxazepine-5(2*H*)-carboxylate (1.95 g, 7.03 mmol) in 40 mL of benzene in a flask fitted with a Dean-Stark trap and a condenser was added diethyl malonate (1.07 mL, 7.03 mmol), piperidine (0.076 mL, 0.77 mmol) and benzoic acid (0.09 g, 0.70 mmol). The resulting solution was stirred at
10 80 °C for 24 h with collection of water in the Dean-Stark trap. The reaction mixture was then cooled, diluted with ethyl acetate, washed with 1N HCl, sat'd aq NaHCO₃ and brine, dried (MgSO₄), filtered through a pad of silica gel and concentrated to afford 2.9 g of a diester intermediate.
15 This material was dissolved in 20 mL of methylene chloride and then there was added 5 mL of trifluoroacetic acid. This mixture was allowed to stir at ambient temperature for 4 h. The volatiles were then removed in vacuo and the residue was dissolved in ethyl acetate, washed with water, sat'd aq NaHCO₃ and brine, dried (MgSO₄), filtered through a pad of silica gel and concentrated. The residue was
20 purified by flash chromatography (elution with 3:1 hexane/ethyl acetate) to afford 1.3 g of a non-cyclized diester resulting from the undesired 9-formyl regioisomer
25 and 0.55 g (29%) of the title compound of Part C. ¹H NMR (CDCl₃) δ: 8.31 (s, 1H), 7.32-7.27 (m, 1H), 7.25-7.20 (m, 1H), 7.12 (t, 1H, J = 7.7 Hz), 4.66 (t, 2H, J = 5.7 Hz), 4.42 (q, 2H, J = 7.1 Hz), 4.31 (t, 2H, J = 7.0 Hz), 2.38-2.30 (m, 2H), 1.42 (t, 3H, J = 7.1 Hz). LRMS (ES)⁺: 274.2
30 (M+H)⁺.

Part D. (+)-*cis* ethyl 11-benzyl-9-oxo-6,7,10,11,12,12a-hexahydro-5*H*-[1,4]oxazepino[2,3,4-*ij*]pyrrolo[3,4-*c*]quinoline-9*a*(9*H*)-carboxylate.

35 To a solution of ethyl 6-oxo-3,4-dihydro-2*H*,6*H*-[1,4]oxazepino[2,3,4-*ij*]quinoline-7-carboxylate (0.46 g, 1.68 mmol) in 20 mL of methylene chloride was added *N*-

(methoxymethyl)-*N*-(trimethylsilylmethyl)benzylamine (0.80 g, 3.37 mmol) and trifluoroacetic acid (0.03 mL, 0.34 mmol). The reaction mixture was stirred at 40 °C for 2 h.

The reaction mixture was allowed to cool and was concentrated. The residue was dissolved in ethyl acetate and was washed with sat'd aq. NaHCO₃ and brine, dried (MgSO₄), filtered through a pad of silica gel and concentrated. The residue was recrystallized from hexane/ethyl acetate to afford the title compound of Part 10 D. ¹H NMR (CDCl₃) δ: 7.33-7.20 (m, 5H), 6.93-6.90 (m, 2H), 6.85-6.80 (m, 1H), 4.50-4.37 (m, 2H), 4.00-3.85 (m, 3H), 3.75-3.65 (m, 3H), 3.42-3.35 (m, 1H), 3.37 (ABq, 2H, J_{AB} = 9.5 Hz), 3.33-3.28 (m, 1H), 3.11 (t, 1H, J = 9.0 Hz), 2.15-2.07 (m, 1H), 2.05-1.97 (m, 1H), 0.92 (t, 3H, J = 7.0 Hz).
15 LRMS (ES)⁺: 407.1 (M+H)⁺.

Part E. (+)-*cis*-11-benzyl-6,7,10,11,12,12a-hexahydro-5H-[1,4]oxazepino[2,3,4-*ij*]pyrrolo[3,4-*c*]quinolin-9(9aH)-one.

To a solution of (+)-*cis* ethyl 11-benzyl-9-oxo-6,7,10,11,12,12a-hexahydro-5H-[1,4]oxazepino[2,3,4-*ij*]pyrrolo[3,4-*c*]quinoline-9a(9H)-carboxylate (0.45 g, 1.11 mmol) in 20 mL of 1,4-dioxane was added 20 mL of 3N HCl and the resulting mixture was stirred at 100 °C for 24 h. The dioxane and most of the water was removed in vacuo, and the residue was basified with sat'd aq Na₂CO₃ and extracted with ethyl acetate. The layers were separated and the organics were washed with brine, dried (MgSO₄), filtered through a pad of silica gel and concentrated to afford 0.33 g (89%) of the title compound of EXAMPLE 120 as an off-white powder. ¹H NMR (CDCl₃) δ: 7.41-7.27 (m, 5H), 6.97-6.81 (m, 3H), 4.60 (dt, 1H), 4.40 (ddd, 1H), 4.13 (ddd, 1H), 3.85-3.75 (m, 1H), 3.82 (broad s, 2H), 3.68-3.57 (m, 1H), 3.52-3.40 (m, 2H), 3.28-3.20 (m, 1H), 3.20-3.10 (m, 1H), 2.56 (t, 1H, J = 9.9 Hz), 2.25-2.10 (m, 2H). Part B. 1-[(1-benzyl-1,2,3,6-tetrahydro-4-pyridinyl)carbonyl]-1,2,3,4-tetrahydroquinoline.

To a solution of 1-isonicotinoyl-1,2,3,4-tetrahydroquinoline (6.50 g, 27.3 mmol) in 100 mL of acetone was added benzyl bromide (10.8 mL, 90.8 mmol) and the resulting solution was stirred at 70 °C for 4 h. The mixture was allowed to cool to room temperature and the resulting solid was filtered, washed with acetone and dried 15 in vacuo to afford 8.8 g of an intermediate quaternary salt. This solid was suspended in 20 mL of absolute ethanol, cooled to 0 °C and then there was added, over a 20 min period, sodium borohydride (2.44 g, 64.5 mmol) as a solution in 25 mL of water and 2.5 mL of 50% NaOH. The reaction was allowed to warm to room temperature and was 20 stirred for 3 h. The reaction was diluted with ethyl acetate, washed with water and brine, dried (MgSO₄) and concentrated. The residue was purified by flash chromatography (elution with 1:1 hexane/ethyl acetate) to afford 5.6 g (79%) of the title compound of Part B. ^1H NMR (CDCl₃) δ : 7.35-7.02 (overlapping m, 9H), 5.93 (app s, 1H), 3.81 (t, 2H, J = 6.4 Hz), 3.57 (s, 2H), 3.01 (d, 2H, J = 2.9 Hz), 2.75 (t, 2H, J = 6.6 Hz), 2.57 (t, 2H, J = 5.7 Hz), 2.27 (app d, 2H, J = 1.5 Hz), 2.02-1.91 (m, 2H). Part C. *tert*-butyl 4-(3,4-dihydro-1(2*H*)-quinolinylcarbonyl)-3,6-dihydro-1(2*H*)-pyridinecarboxylate.

To a solution of 1-[(1-benzyl-1,2,3,6-tetrahydro-4-pyridinyl)carbonyl]-1,2,3,4-tetrahydroquinoline (5.7 g, 17.1 mmol) in 1,2-dichloroethane (50 mL) was added 1-chloroethyl chloroformate (ACE-Cl) (1.84 mL, 17.1 mmol) and the mixture was stirred at reflux for 1 h. The volatiles were removed in vacuo and the residue was dissolved in methanol and stirred at reflux for 1 h. The reaction was cooled and concentrated in vacuo to afford an amine salt. This salt was taken up in methylene chloride and then there was added triethylamine (2.61 mL, 18.7 mmol) and di-*tert*-butyl dicarbonate (4.46 g, 20.5 mmol). The reaction was stirred at room temperature for 4 h. The reaction mixture was filtered through a pad of silica gel and concentrated to afford 4.6 g (79%) of the title compound of Part C, which was used without purification.

Part D. (+)-*cis* *tert*-butyl 8-oxo-5,6,8,8a,9,10,12,12a-octahydro-4*H*,11*H*-quino[1,8-*bc*]-2,6-naphthyridine-11-carboxylate.

A solution of *tert*-butyl 4-(3,4-dihydro-1(2*H*)-quinolinylcarbonyl)-3,6-dihydro-1(2*H*)-pyridinecarboxylate (4.5 g, 13.1 mmol) in 200 mL of toluene was cooled with a water jacket and was irradiated with a mercury vapor lamp for 3 ½ days. The mixture was concentrated in vacuo. The residue was purified by flash chromatography (elution with 3:1 hexane/ethyl acetate) to afford a 3:1 mixture of the desired *cis* and undesired *trans* ring fusion isomers. Recrystallization of this mixture from absolute ethanol afforded 2.4 g (53%) of the desired *cis* isomer title compound of Part D as a white solid.

Part E. (+)-*cis* *tert*-butyl 5,6,8,8a,9,10,12,12a-octahydro-4*H*,11*H*-quino[1,8-*bc*]-2,6-naphthyridine-11-carboxylate.

UTILITY

The compounds of the present invention have therapeutic utility for illnesses or disorders involving the neurotransmitter serotonin (5-hydroxy tryptamine or 5-HT) and either agonism or antagonism of 5-HT2 receptors, as demonstrated by the assays described below. Therapeutic utility for these illnesses or disorders could involve numerous biological processes affected by serotonin including, but not limited to, appetite, mood, sleep, sexual activity, and arterial constriction. These biological processes may also be important to numerous central nervous system (CNS) disorders including those related to the affective disorders of depression, anxiety, psychosis, and schizophrenia, as well as, disorders of food intake such as anorexia, bulimia, and obesity. The compounds of the present invention potentially have therapeutic utility in other conditions in which serotonin has been implicated, such as migraine, attention deficit disorder or attention deficit hyperactivity disorder, addictive behavior, and obsessive-compulsive disorder, as well as, conditions associated with cephalic pain, social phobias, and gastrointestinal disorders such as dysfunction of the gastrointestinal tract motility. Lastly, compounds of the present invention potentially have therapeutic utility in neurodegenerative diseases and traumatic conditions represented by the examples of Alzheimer's disease and brain/spinal cord trauma.

The pharmacological analysis of each compound for either antagonism or agonism of at 5-HT2A and 5-HT2C receptors consisted of in vitro and in vivo studies. In vitro analyses included K_i determinations at 5-HT2A and 5-HT2C receptors and an assessment of functional (i.e., agonism or antagonism) activity at each receptor class by IP3 hydrolysis assays. Additional receptor assays were conducted to evaluate receptor specificity of 5-HT2A and 5-HT2C receptors over monoamine and nuisance receptors (e.g.

histamine, dopamine, and muscarinic). A compound is considered active as a 5-HT2A antagonist or a 5-HT2C agonist if it has an IC_{50} value or a K_i value of less than about 50 micromolar; preferably less than about 0.1 5 micromolar; more preferably less than about 0.01 micromolar. Using the assays disclosed herein, compounds of the present invention have been shown to have an IC_{50} value of less than about 50 micromolar for 5-HT2A antagonism or 5-HT2C agonism.

10 In vivo assays assessed compound activity in a variety of behavioral paradigms including quipazine head twitch, acute and chronic feeding models, anxiety and depression models (learned-helplessness, elevated plus maze, Geller-Sieffter, conditioned taste aversion, taste reactivity, 15 satiety sequence). In aggregate, these models reflect activity as a 5-HT2A antagonist (quipazine head twitch, depression models) or 5-HT2C agonist (feeding models, anxiety models, depression models) and provide some indication as to bioavailability, metabolism and 20 pharmacokinetics.

25 Radioligand binding experiments were conducted on recombinant human 5-HT2A and 5-HT2C receptors expressed in HEK293E cells. The affinities of compounds of the present invention to bind at these receptors is determined by their capacity to compete for [^{125}I]-1-(2,5-dimethoxy-4-iodophenyl)-2-amino-propane (DOI) binding at the 5-HT2A or 5-HT2C. pharmacological differences in the interaction of serotonin with 5-hydroxytryptamine1C and 5-hydroxytryptamine2 receptors. Mol Pharmacol., 42(2):328-35.

The functional properties of compounds (efficacy and 5 potency) were determined in whole cells expressing 5-HT2A or 5-HT2C receptors by assessing their ability to stimulate or inhibit receptor-mediated phosphoinositol hydrolysis. The procedures used are described below.

10 **In Vitro Binding Assays**

Stable expression of 5-HT2A and 5-HT2C receptors in HEK293E cells.

Stable cell lines were generated by transfecting 15 293EBNA cells with plasmids containing human 5-HT2A , 5-HT2B, or 5-HT2C (VNV edited isoform) cDNA using calcium phosphate. These plasmids also contained the cytomegalovirus (CMV) immediate early promoter to drive receptor expression and EBV oriP for their maintenance as 20 an extrachromosomal element, and the hph gene from E. Coli to yield hygromycin B resistance (Horlick et al., 1997). Transfected cells were maintained in Dulbecco's Modified Eagle medium (DMEM) containing dialyzed 10% fetal bovine serum at 37°C in a humid environment (5% CO₂) for 10 days. 25 The 5-HT2A cells were adapted to spinner culture for bulk processing whereas it was necessary to maintain the other lines as adherent cultures. On the day of harvest, cells were washed in phosphate-buffered saline (PBS), counted, and stored at -80 °C.

30

Membrane Preparation

On the day of assay, pellets of whole cells (containing approximately 1 X 10⁸ cells) expressing the 5-HT2A or 5-HT2C receptor were thawed on ice and homogenized 35 in 50 mM Tris HCl (pH 7.7) containing 1.0 mM EDTA using a Brinkman Polytron (PT-10, setting 6 for 10 sec). The homogenate was centrifuged at 48,000 x g for 10 min and the

resulting pellet washed twice by repeated homogenization and centrifugation steps. The final pellet was resuspended in tissue buffer and protein determinations were made by the bicinchoninic acid (BCA) assay (Pierce Co., IL) using 5 bovine serum albumin as the standard.

5 Radioligand binding assays for the 5-HT2A , and 5-HT2C receptors.

10 Radioligand binding studies were conducted to determine the binding affinities (KI values) of compounds for the human recombinant 5-HT2A, 5-HT2B, and 5-HT2C receptors (Fitzgerald et al., 1999). Assays were conducted in disposable polypropylene 96-well plates (Costar Corp., Cambridge, MA) and were initiated by the addition of 5-HT2A 15 , 5-HT2B, or 5-HT2C membrane homogenate in tissue buffer (10-30 (g/well) to assay buffer (50 mM Tris HCl, 0.5 mM EDTA, 10 mM pargyline, 10 mM MgSO₄, 0.05% ascorbic acid, pH 7.5) containing [¹²⁵I]DOI for the 5-HT2A and 5-HT2C receptors (0.3-0.5 nM, final) or [³H]LSD (2-2.5 nM, final) 20 for the 5-HT2B receptor, with or without competing drug (i.e, newly synthesized chemical entity). For a typical competition experiment, a fixed concentration of radioligand was competed with duplicate concentrations of ligand (12 concentrations ranging from 10 picomolar to 10 25 micromolar). The reaction mixtures were incubated to equilibrium for 45 min at 37°C and terminated by rapid filtration (cell harvestor; Inotech Biosystems Inc., Lansing, MI) over GFF glass-fiber filters that had been pre-soaked in 0.3% polyethyleneimine. Filters were washed 30 in ice-cold 50 mM Tris HCl buffer (pH 7.5) and then counted in a gamma counter for the 5-HT2A and 5-HT2C assays, or by liquid scintillation spectroscopy for the 5-HT2B assay.

35 Phosphoinositide hydrolysis studies.

The ability of newly synthesized compounds to stimulate phosphoinositide (PI) hydrolysis was monitored in whole cells using a variant (Egan et al., 1998) of a

protocol described previously (Berridge et al., 1982). HEK293E cells expressing the human 5-HT2A, 5-HT2B, or 5-HT2C receptor were lifted with 0.5 mM EDTA and plated at a density of 100,000/well onto poly-D-lysine-coated 24-well plates (Biocoat; Becton Dickinson, Bedford, MA) in Dulbecco's modified Eagle's serum (DMEM; Gibco BRL) containing high glucose, 2mM glutamine, 10% dialyzed fetal calf serum, 250 (g/ml) hygromycin B, and 250(g/ml) G418. Following a 24-48 hr period, the growth media was removed and replaced with DMEM without fetal calf serum and inositol (Gibco BRL). The cells were then incubated with DMEM (without serum and inositol) containing a final concentration of 0.5 uCi/well myo-[³H]inositol for 16-18 hr. Following this incubation, the cells were washed with DMEM (without serum or inositol) containing 10 mM LiCl and 10 (M pargyline and then incubated for 30 min with the same media but now containing one of several test compounds. Reactions were terminated by aspirating the media and lysing the cells by freeze-thaw. [³H]phosphoinositides were extracted with chloroform/methanol (1:2 v/v), separated by anion exchange chromatography (Bio-Rad AGI-X8 resin), and counted by liquid scintillation spectroscopy as described previously (Egan et al., 1998).

25 Data analyses

The equilibrium apparent dissociation constants (Ki's) from the competition experiments were calculated using an iterative nonlinear regression curve-fitting program (GraphPad Prism; San Diego, CA). For the PI hydrolysis experiments, EC50's were calculated using a one-site 'pseudo' Hill model: $y=((R_{max}-R_{min})/(1+R/EC50)^nH) + R_{max}$ where R= response (DeltaGraph, Monterey, CA). Emax (maximal response) was derived from the fitted curve maxima (net IP stimulation) for each compound. Intrinsic activity (IA) was determined by expressing the Emax of a compound as a percentage of the Emax of 5-HT (IA=1.0).

In Vivo Experiments for Serotonergic Ligands.

Preclinical Efficacy, Potency, and Side Effect Liability.

a) Anti-Serotonin Efficacy.

5 Antagonism of Quipazine-Induced Head Twitch in Rat. Quipazine, an agonist at 5-HT receptors, produces a characteristic head twitch response in rats. 5-HT receptor antagonists effectively antagonize this 5-HT agonist-induced behavioral effect (Lucki et al., 1984).

10 Accordingly, the quipazine-induced head twitch model in rat can function as an in vivo behavioral correlate to 5-HT receptor binding. Compounds are administered 30 minutes before behavioral testing (and 25 minutes before quipazine), and a dose-related antagonism of the quipazine response is determined.

b) Antipsychotic Efficacy.

20 Inhibition of the Conditioned Avoidance Response (CAR) in Rat. Rats are trained to consistently avoid (by climbing onto a pole suspended from the ceiling of the test chamber) an electric foot shock (0.75 mA) delivered to the grid floor of the testing chamber. All antipsychotic drugs effectively inhibit this conditioned avoidance response (Arnt, 1982). The ability of a compound to inhibit this response is used to determine the antipsychotic efficacy of potential drug candidates.

c) Extrapyramidal Side Effect Liability.

30 Induction of Catalepsy in Rat. Typical antipsychotic drugs produce extrapyramidal side effects (EPS) at clinically effective doses. The most widely accepted preclinical indicator of EPS liability in humans is a drug-induced catalepsy syndrome in rat (Costall and Naylor, 1975), a condition whereby the animal will remain immobile 35 in an externally imposed posture (analogous to a catatonic stupor in humans). Rats are tested for induction of

catalepsy in a dose-response test after oral administration of compounds.

d) CNS penetration; In vivo brain receptor occupancy.

5 In Vivo Binding. To determine the level of in vivo receptor occupancy, an in vivo receptor binding protocol is used. This procedure uses an appropriate radioligand to label the receptor of interest. For example, to measure both Dopamine D2 and 5-HT2A receptors in vivo, one can use
10 ^3H -N-methyl spiperone (^3H -NMSP), (Frost, et. al. 1987) The procedure uses rats (or mice) fasted overnight. To measure the effects of compounds on the receptors of interest, compounds are dosed, usually p.o. for example in 2 microliters/gram body weight in 0.25% Methocel
15 suspension. The radiolabeled compound (in this example, ^3H -NMSP) is administered by i.v. tail vein injection (10 microcuries label/200 gram rat). Time course experiments are used to determine the optimal time of binding for both the radiolabeled and unlabeled compound. These optimal
20 time frames are used for all subsequent dose-response experiments. After the appropriate time frame of compound/radioligand exposure, the animals are sacrificed and the relevant brain regions dissected (frontal cortex for 5-HT2A and striatum for D2 receptors) and examined for
25 their content of radioactivity. The level of non-specific binding is determined by examining a brain region known not to contain the receptor of interest (in this case the cerebellum) or by administering an excess of compound known pharmacologically to interact with the receptor.

Dosage and Formulation

35 The serotonin agonist and serotonin antagonist compounds of this invention can be administered as treatment for the control or prevention of central nervous system disorders including obesity, anxiety, depression,

psychosis, schizophrenia, sleep and sexual disorders, migraine and other conditions associated with cephalic pain, social phobias, and gastrointestinal disorders such as dysfunction of the gastrointestinal tract motility by
5 any means that produces contact of the active agent with the agent's site of action, i.e., 5-HT2 receptors, in the body of a mammal. It can be administered by any conventional means available for use in conjunction with pharmaceuticals, either as an individual therapeutic agent
10 or in a combination of therapeutic agents. It can be administered alone, but preferably is administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

15 The compounds of the present invention can be administered in such oral dosage forms as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions, syrups, and emulsions. Likewise,
20 they may also be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, all using dosage forms well known to those of ordinary skill in the pharmaceutical arts.

The dosage administered will, of course, vary
25 depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and route of administration; the age, health and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; and
30 the effect desired. By way of general guidance, a daily dosage of active ingredient can be expected to be about 0.001 to about 1000 milligrams per kilogram of body weight, with the preferred dose being about 0.01 to about 100 mg/kg; with the more preferred dose being about 0.1 to
35 about 30 mg/kg. Advantageously, compounds of the present invention may be administered in a single daily dose, or

the total daily dosage may be administered in divided doses of two, three, or four times daily.

Dosage forms of compositions suitable for administration contain from about 1 mg to about 100 mg of active ingredient per unit. In these pharmaceutical compositions the active ingredient will ordinarily be present in an amount of about 0.5-95% by weight based on the total weight of the composition. The active ingredient can be administered orally in solid dosage forms, such as capsules, tablets and powders, or in liquid dosage forms, such as elixirs, syrups and suspensions. It can also be administered parenterally, in sterile liquid dosage forms.

Gelatin capsules contain the active ingredient and powdered carriers, such as lactose, starch, cellulose derivatives, magnesium stearate, stearic acid, and the like. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of hours. Compressed tablets can be sugar coated or film coated to mask any unpleasant taste and protect the tablet from the atmosphere, or enteric coated for selective disintegration in the gastrointestinal tract. Liquid dosage forms for oral administration can contain coloring and flavoring to increase patient acceptance.

In general, water, a suitable oil, saline, aqueous dextrose (glucose), and related sugar solutions and glycols such as propylene glycol or polyethylene glycols are suitable carriers for parenteral solutions. Solutions for parenteral administration preferably contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, buffer substances. Antioxidizing agents such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or combined, are suitable stabilizing agents. Also used are citric acid and its salts, and sodium EDTA. In addition, parenteral solutions can contain preservatives, such as benzalkonium chloride,

methyl- or propyl-paraben and chlorobutanol. Suitable pharmaceutical carriers are described in *Remington's Pharmaceutical Sciences, supra*, a standard reference text in this field.

5 Useful pharmaceutical dosage-forms for administration of the compounds of this invention can be illustrated as follows:

Capsules

10 A large number of unit capsules can be prepared by filling standard two-piece hard gelatin capsules each with 100 mg of powdered active ingredient, 150 mg of lactose, 50 mg of cellulose, and 6 mg magnesium stearic.

15 Soft Gelatin Capsules

A mixture of active ingredient in a digestible oil such as soybean oil, cottonseed oil or olive oil can be prepared and injected by means of a positive displacement pump into gelatin to form soft gelatin capsules containing 100 mg of the active ingredient. The capsules should then be washed and dried.

Tablets

25 A large number of tablets can be prepared by conventional procedures so that the dosage unit is 100 mg of active ingredient, 0.2 mg of colloidal silicon dioxide, 5 milligrams of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch and 98.8 mg of lactose. Appropriate coatings may be applied to increase palatability or delay absorption.

Suspension

35 An aqueous suspension can be prepared for oral administration so that each 5 mL contain 25 mg of finely divided active ingredient, 200 mg of sodium carboxymethyl cellulose, 5 mg of sodium benzoate, 1.0 g of sorbitol solution, U.S.P., and 0.025 mg of vanillin.

Injectable

A parenteral composition suitable for administration by injection can be prepared by stirring 1.5% by weight of active ingredient in 10% by volume propylene glycol and water. The solution is sterilized by commonly used techniques.
